

Curs 6

2017/2018

Programarea aplicațiilor web

CURS

I.	HTML si XHTML (recapitulare)	1 oră
II	CSS	2 ore
III	Baze de date, punct de vedere practic	1 oră
IV	Limbajul de interogare SQL	4 ore
V	PHP - HyperText Preprocessor	8 ore
VI	XML - Extended Mark-up Language si aplicatii	4 ore
VII	Conlucrare intre PHP/MySql, PHP/XML, Javascript/HTML	2 ore
VIII	Exemple de aplicatii	6 ore
	Total	28 ore

! Important

- Laborator **asincron!**

- recomandat – 4 = Optim

Magazin online Firma X SRL

Rezultate comanda

Pret total (fara TVA): 350

Pret total (cu TVA): 416.5

Comanda receptionata la data: 17/03/2010 ora 08:24

Plan aplicatie

- Pe masura ce aplicatia paraseste un fir liniar de executie este necesara introducerea unui plan (graf) al aplicatiei
- Cumparator
 - citirea datelor de pe disc se realizeaza in **antet.php**, comun pentru toate fisierele

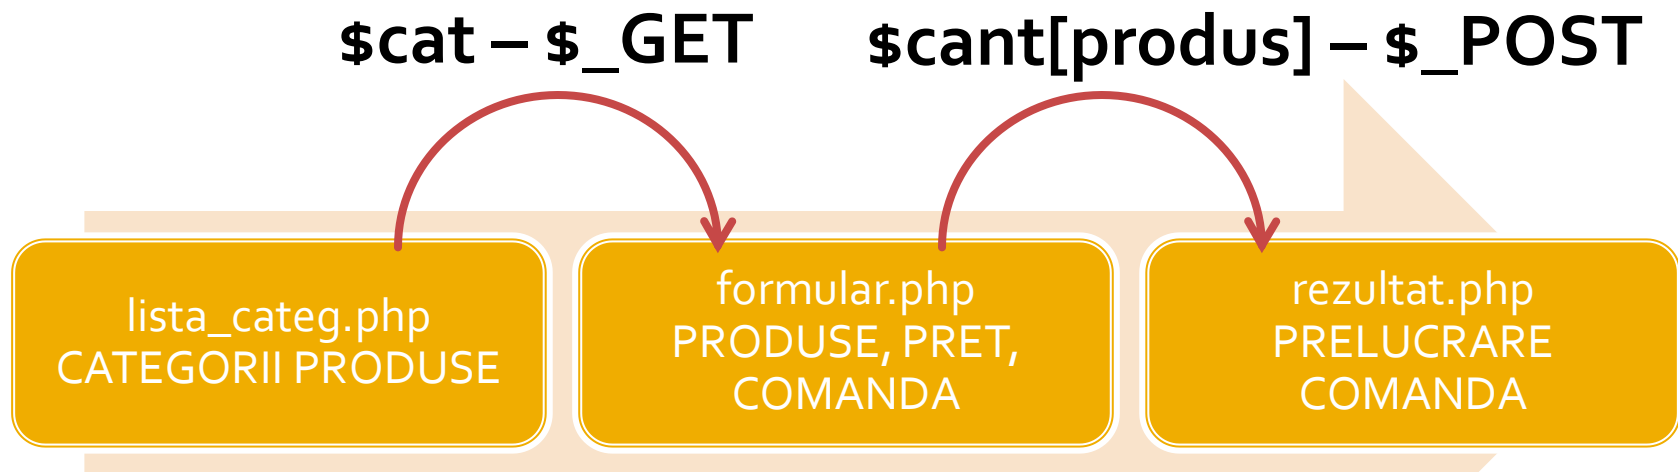

lista_categ.php
CATEGORII PRODUSE

formular.php
PRODUSE, PRET,
COMANDA

rezultat.php
PRELUCRARE
COMANDA

Plan aplicatie

- Planul aplicatiei trebuie sa cuprinda si informatii relative la:
 - **ce date** se transmit intre diferitele pagini
 - **cum** se transmit datele intre pagini

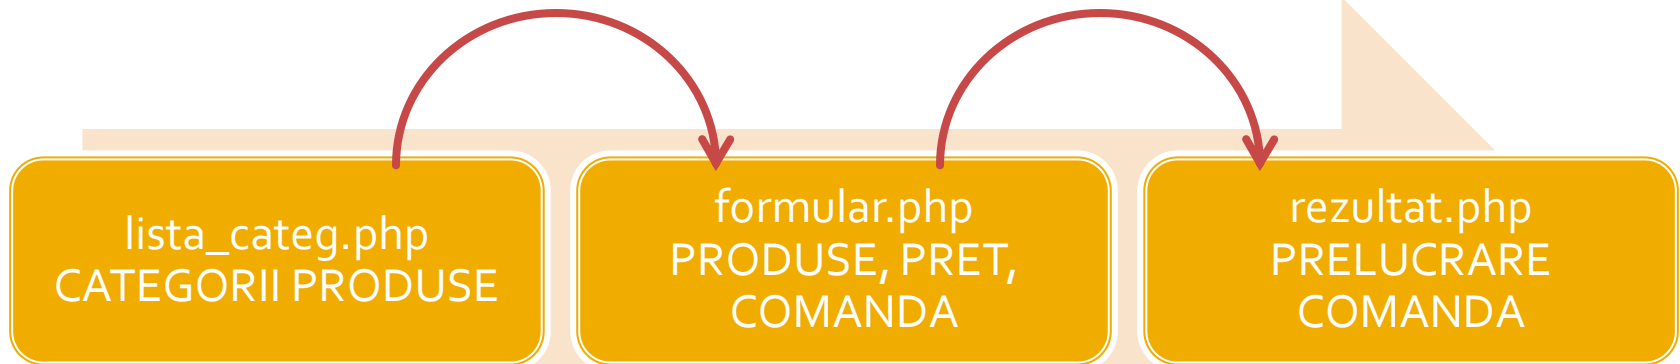

Plan aplicatie

- Planul aplicatiei – Exemplu
 - lista de categorii va contine “**link-uri active**” deci transmiterea unei singure variabile se face cu **\$_GET**
 - formularul de comanda transmite date multiple incluse intr-o forma deci transmiterea se face cu **\$_POST**
- Alegerea \$_GET/\$_POST are implicatii:
 - atat in pagina care transmite datele
 - cat si in pagina care le receptioneaza

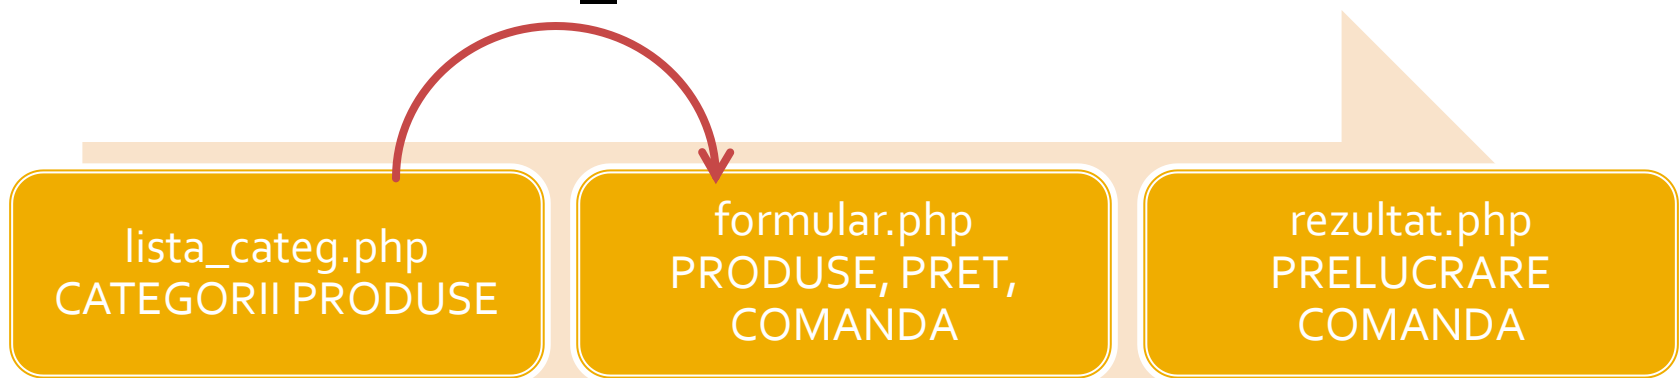

\$cat – \$_GET

\$cant[produs] – \$_POST

Link-uri active

- folosite pentru a transmite o **informatie**
- in `lista_categ.php`
 - `<a href="lista_prod.php?categ=<?php echo $cat;?>"> <?php echo $cat;?> `
- are efect in `formular.php`
 - `$_GET['categ']="valoarea $cat corespunzatoare"`
\$cat – \$_GET

Laborator 5

- Sa se continue magazinul virtual cu:
 - produsele sunt grupate pe **categorii** de produse
 - sa prezinte utilizatorului o lista de categorii de produse pentru a alege
 - sa prezinte utilizatorului o lista de produse si preturi in categoria aleasa
 - lista de produse si preturi se citeste dintr-un **fișier**
 - se preia comanda si se calculeaza suma totala
- Optional
 - se creaza o pagina prin care vanzatorul poate **modifica** preturile si produsele

Laborator 5 – Mod de lucru

- 1. Se introduce in surse facilitatea template
- 2. Se modifica sursele pentru lucru cu matrici
- 3. Se modifica sursele pentru a citi datele de pe disc (C5 – fisier text)
 - **anterior** se creaza fisierul text sau:
 - **o singura data** se salveaza datele (C5 – S72)
- 4. Se introduce structura suplimentara, categorie
 - se **creaza pagina** de selectie a categoriei, din care se va merge in lista de produse (utilizare \$_GET – S103)
- 5. Lista de produse si preturi se citeste dintr-un fisier **XML**
- 6. Optional: Se creaza o pagina care sa permita modificarea fisierului text/XML
 - numai pret/descriere, fara adaugare/schimbare produse

Laborator 4 – Matrice produse

Laborator 5

- exemplu de grupare
- apare un nivel suplimentar de noduri in arbore
 - deci apare un indice suplimentar in matrice

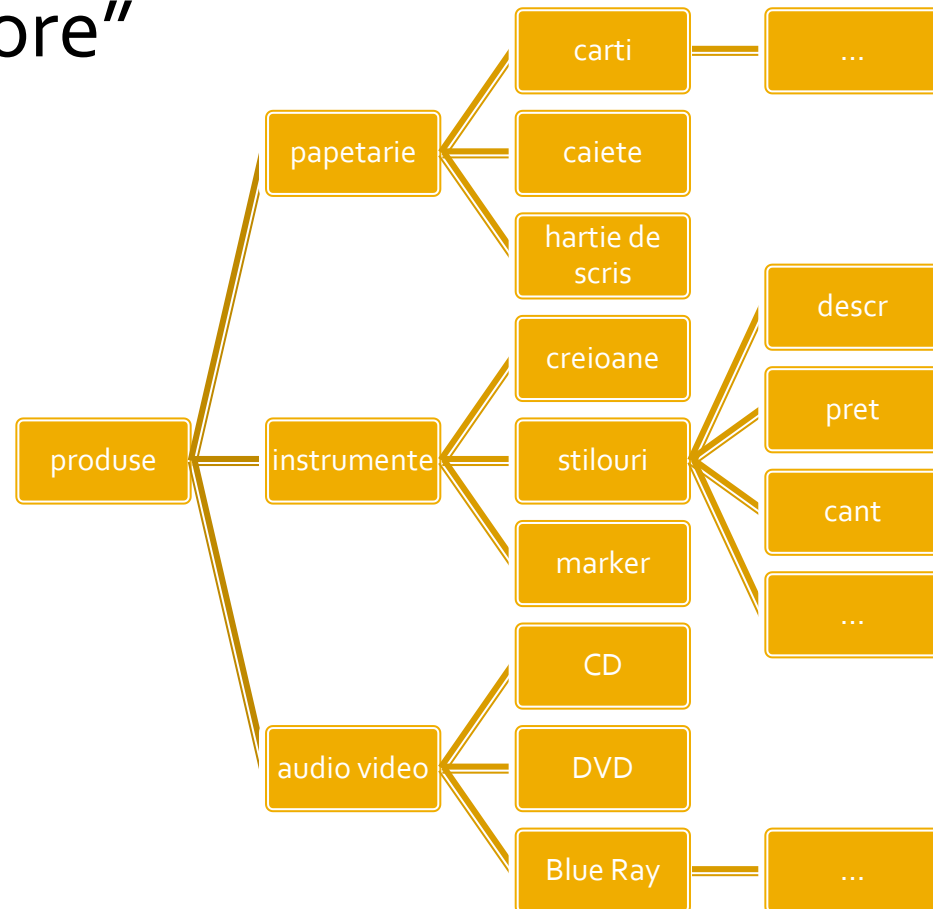

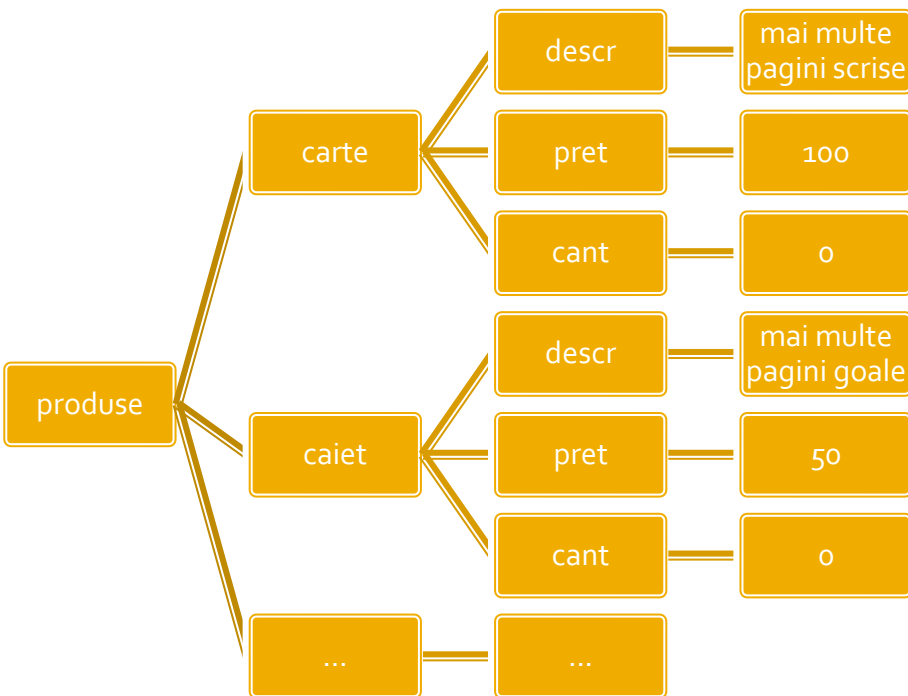

```
$produse = array ( 'carte' => array ("descr" => ... ), ... );
```

```
$produse = array ( 'papetarie' => array ( 'carte' => array ("descr" => ...), ... ) ... );
```

```
$produse['carte']['descr'] ↔ $produse ['papetarie ']['carte']['descr']
```

Matrici

- adaugare nivel in "arbore"

Rezolvare

- modificarea fisierului text cu introducerea categoriei ca prim parametru in fisier

carte	mai multe pagini scrise legate	100	0	
caiet	mai multe pagini goale legate	75	0	
penar	loc de depozitat instrumente de scris	150	0	
stilou	instrument de scris albastru	125	0	
papetarie	carte	mai multe pagini scrise legate	100	0
papetarie	caiet	mai multe pagini goale legate	75	0
instrumente	penar	loc de depozitat instrumente de scris	150	0
instrumente	stilou	instrument de scris albastru	125	0

Cod

- Codul ramane in mare parte acelasi
- Cateva modificari sunt necesare

```
$matr=file("produse.txt");  
foreach ($matr as $linie)  
    {  
        $valori=explode("\t",$linie,4);  
        $produse[$valori[0]]=array ("descr" => $valori[1], "pret" => $valori[2], "cant" => $valori[3]);  
    }
```

```
$matr=file("produse.txt");  
foreach ($matr as $linie)  
    {  
        $valori=explode("\t",$linie,5);  
        $produse[$valori[0]] [$valori[1]]=array ("descr" => $valori[2], "pret" => $valori[3], "cant" =>  
$valori[4]);  
    }
```

Acces la date TXT

- Utilizare, cu doua bucle foreach

```
$index=1;
foreach ($produse as $prod => $detalii) //primul indice in $produse imi da produsul
    {?>
<tr><td><?php echo $index;?></td><td><?php echo ucfirst(strtolower($prod));?></td><td><?php echo
$detalii['descr'];?></td><td align="center"><?php echo $detalii['pret'];?></td></tr>
<?php $index++;
    }
```

```
$index=1;
foreach ($produse as $categ => $lista_categ) //primul indice in $produse imi da categoria
    foreach ($lista_categ as $prod => $detalii) //al doilea indice in $produse imi da produsul
        //din categoria stabilita cu primul indice
        {?>
<tr><td><?php echo $index;?></td><td><?php echo $categ;?></td><td><?php echo
ucfirst(strtolower($prod));?></td><td><?php echo $detalii['descr'];?></td><td align="center"><?php
echo $detalii['pret'];?></td></tr>
<?php $index++;
    }
```

Matrici

- structura tip "arbore"

Fisier XML

```
1 <?xml version="1.0" encoding="utf-8"?>
2 <produse user="magazin" password="parola">
3   <categorie nume="papetarie">
4     <produs>
5       <desc>mai multe pagini scrise legate</desc>
6       <nume>carte</nume>
7       <pret>100</pret>
8       <cant>0</cant>
9     </produs>
10    <produs>
11      <desc>mai multe pagini goale legate</desc>
12      <nume>caiet</nume>
13      <pret>75</pret>

27      <pret>150</pret>
28      <cant>0</cant>
29    </produs>
30    <produs>
31      <desc>instrument de scris albastru</desc>
32      <nume>stilou</nume>
```

Acces la date XML

■ Citire, cu doua bucle foreach

```
$matr=file("produse.txt");  
foreach ($matr as $linie)  
{  
    $valori=explode("\t",$linie,5);  
    $produse[$valori[0]] [$valori[1]]=array ("descr" => $valori[2], "pret" => $valori[3], ...);  
}
```

```
$xml = simplexml_load_file("lista.xml");  
if ($xml)  
{  
    foreach ($xml->categorie as $categorie)  
    {  
        $produse[(string)$categorie["nume"]]=array();  
        foreach ($categorie->produs as $prod_cur)  
        {  
            $produse[(string)$categorie["nume"]][(string)$prod_cur->nume] = ...  
        }  
    }  
}
```

Laborator 6+7 MySQL in PHP

Laborator 6+7

- Sa se continue magazinul virtual cu:
 - produsele sunt grupate pe categorii de produse
 - sa prezinte utilizatorului o lista de grupe de produse pentru a alege
 - sa prezinte utilizatorului o lista de produse si preturi in grupa aleasa
 - lista de produse si preturi se citeste dintr-o baza de date **MySQL**
 - se preia comanda si se calculeaza suma totala
 - **se creaza o pagina prin care vanzatorul poate modifica preturile si produsele**

Utilizare template - recomandat

- sectiunile repetabile pot fi mutate intr-un fisier separat si introduse cu `require()`
- se identifica zonele comune

```
<html>
<head>
<title>Magazin online Firma X SRL</title>
</head>
<body bgcolor="#CCFFFF">
<table width="600" border="0" align="center">
<tr><td></td></tr>
<tr><td height="600" valign="top"
bgcolor="#FFFFCC">
Continut
</td></tr>
</table>
</body>
</html>
```

Utilizare template - recomandat

antet.php

```
<html>
<head>
<title>Magazin online Firma X
SRL</title>
</head>
<body bgcolor="#CCFFFF"><?php
define('PRET_CARTE',100);

//orice cod comun PHP

?><table width="600" border="0"
align="center">
<tr><td></td></tr>
<tr><td height="600" valign="top"
bgcolor="#FFFFCC">
<h1>Magazin online Firma X SRL</h1>
```

subsol.php

```
</td></tr>
</table>
</body>
</html>
```

```
<?php require('antet.php');?>
<h2>Lista Produse</h2>
<table border="1">
...
</table>
<?php require('subsol.php');?>
```

Utilizare template

- antet.php
 - citirea datelor si realizarea matricii \$produse se realizeaza aici
 - acest lucru permite sa se realizeze usor trecerea la alte tehnologii txt → XML → MySql
 - restul fisierelor pot ramane (in mare parte) nemodificate deoarece se bazeaza pe utilizarea matricii \$produse, indiferent cum e ea realizata
- subsol.php
 - se poate utiliza la realizarea interfetei pentru vanzator
 - se salveaza matricea \$produse in formatul necesar tehnologiei utilizate

Plan aplicatie – Cumparator

- Pe masura ce aplicatia paraseste un fir liniar de executie este necesara introducerea unui plan (graf) al aplicatiei
- Cumparator
 - citirea fisierului XML (accesarea bazei de date) se realizeaza in antet.php, comun pentru toate fisierele

lista_categ.php

formular.php
PRODUSE, PRET,
COMANDA

rezultat.php
PRELUCRARE
COMANDA

Plan aplicatie – Vanzator

- Aparitia aplicatiei pentru vanzator
 - introduce un fir paralel de executie cu necesitatea alegerii initiale: cumparator/vanzator
 - aduce posibilitatea scrierii fisierului XML
 - diverse operatii de scriere
 - introducere categorie de produse
 - introducere produs nou intr-o categorie existenta
 - modificare produs existent
 - modificarea fisierului implica 2 actiuni:
 - colectare date
 - prelucrare

Fisier unic pentru colectare SI prelucrare date

- De multe ori se prefera aceasta varianta
- Permite pastrarea unitara a tuturor operatiilor pentru indeplinirea unei actiuni
 - acces mai simplu
 - usurinta la programare
 - evitarea erorilor: File does not exist: D:/Server/...
- Acelasi fisier e folosit initial pentru a colecta date si apoi, daca se detecteaza prezenta acestora, pentru prelucrarea lor

Fisier unic pentru colectare SI prelucrare date

- Fisierul de receptie pentru <form> va fi fisierul curent
- se recomanda utilizarea variabilei globale `$_SERVER['SCRIPT_NAME']`
 - flexibilitate la redenumirea fisierelor
- alternativ `$_SERVER['PHP_SELF']` nu este recomandata
 - probleme de securitate
- Sectiunea de colectare date se afiseaza numai in absenta datelor

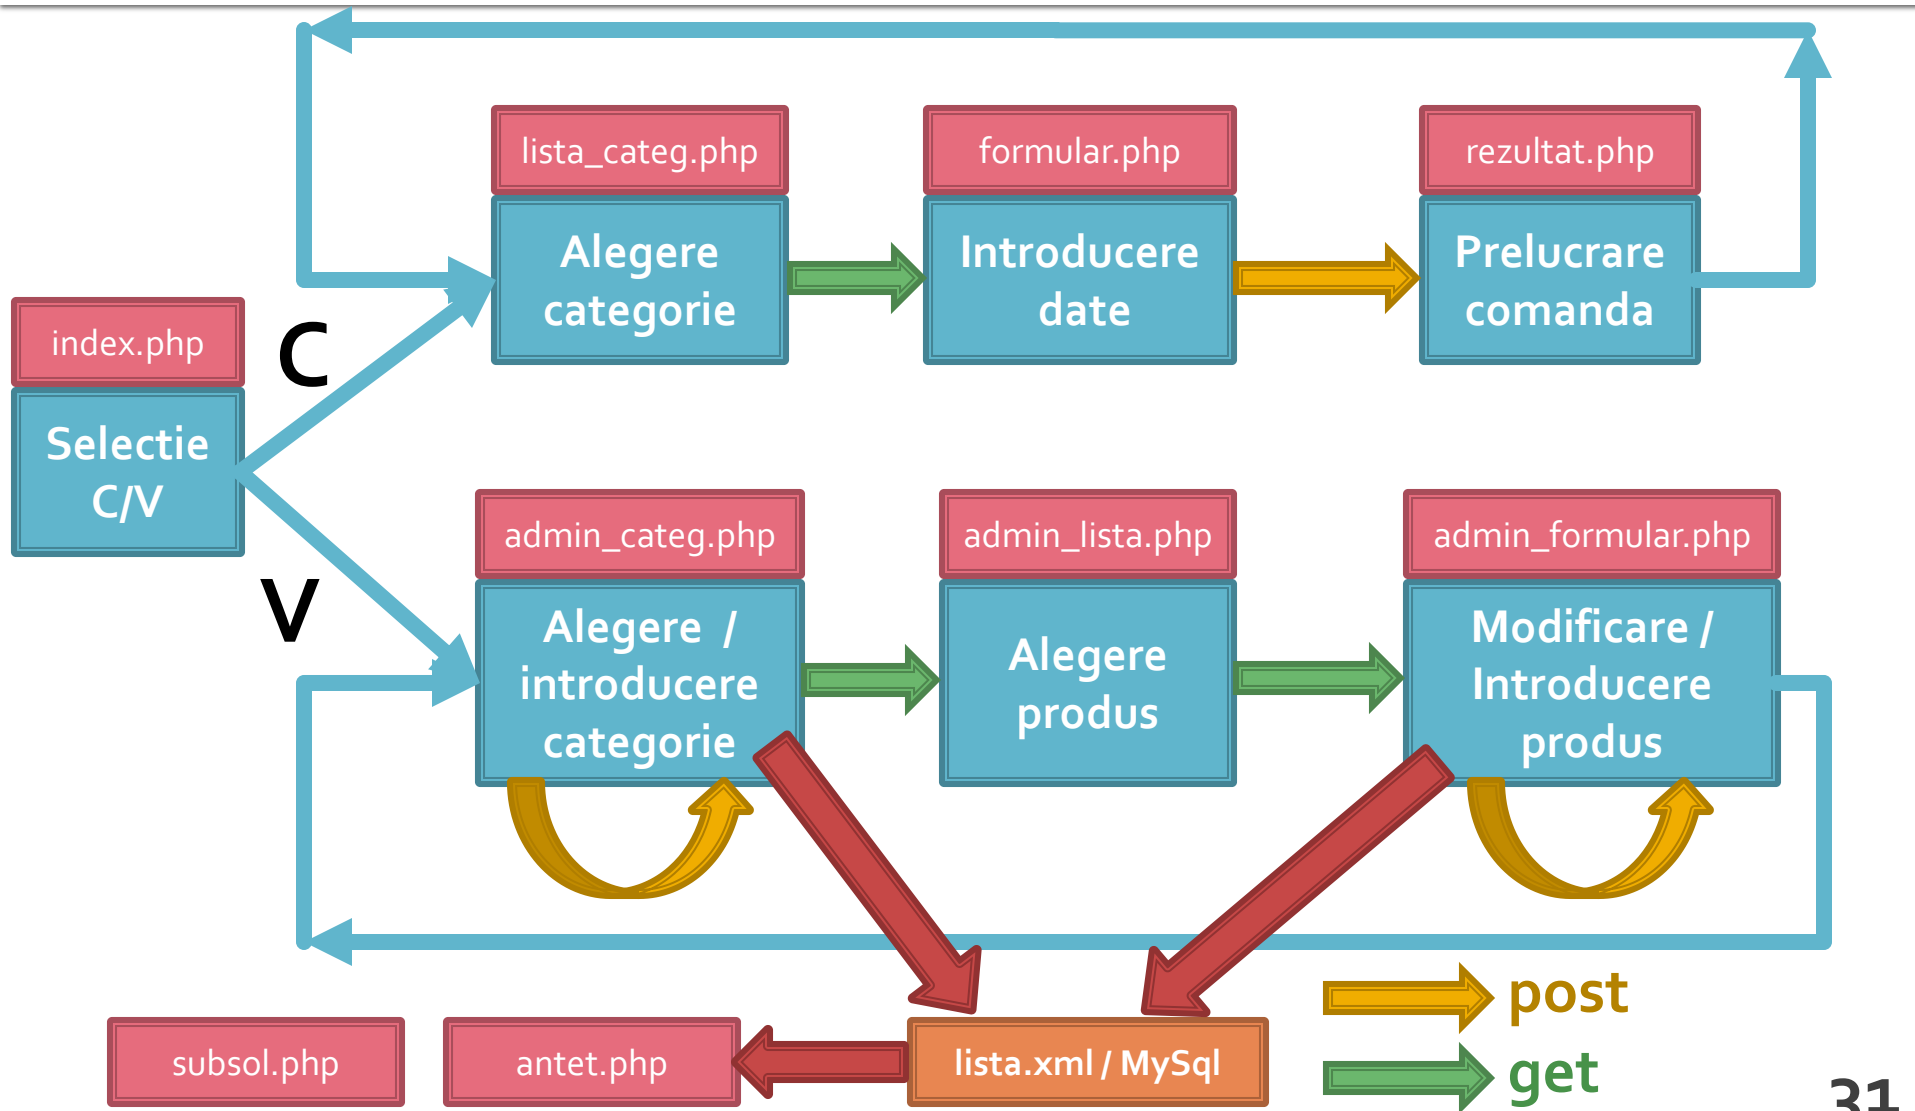

```
<form action="<?php echo $_SERVER['SCRIPT_NAME'];?>" method="post">  
<p><input name="date_ok" type="submit" value="Trimite" /></p>  
</form>
```

Fisier unic pentru colectare SI prelucrare date

- Detectia existentei datelor se face prin verificarea existentei (isset(\$variabila)) valorilor introduse
 - eventual pentru un plus de protectie se poate verifica si continutul lor

```
if (isset($_POST[" date_ok "]))
{ //date trimise
  if ($_POST[" date_ok "]=="Trimite" )
    { //date trimise de fisierul curent
      //prelucrare
    }
}
else
{
  //colectare date
  <form action="<?php echo $_SERVER['SCRIPT_NAME '];?>" method="post">
  <p><input name="date_ok" type="submit" value="Trimite" /></p></form>
}
```

Laborator 6

- Sa se continue magazinul virtual cu:
 - produsele sunt grupate pe categorii de produse
 - sa prezinte utilizatorului o lista de grupe de produse pentru a alege
 - sa prezinte utilizatorului o lista de produse si preturi in grupa aleasa
 - lista de produse si preturi se citeste dintr-o baza de date **MySQL**
 - se preia comanda si se calculeaza suma totala
 - **se creaza paginile prin care vanzatorul poate modifica preturile, produsele, categoriile**

MySql

Accesul la metode externe de stocare eficiente a datelor

MySql vs. XML

- XML - eXtensible Markup Language
- XML isi atinge limitarile atunci cand:
 - cantitatea de date este mare
 - prelucrarile datelor sunt complexe
- In general XML citeste in intregime fisierul care contine datele
 - memoria necesara script-urilor PHP poate creste pana in punctul atingerii ineficientei
- Prelucrarile trebuie facute in PHP
 - PHP este limbaj interpretat deci ineficient pentru prelucrari masive de date

MySql

- Baza de date – instrument pentru stocarea si manipularea informatiei eficient si efectiv
 - datele sunt protejate de corupere sau pierderi accidentale
 - nu se utilizeaza mai multe resurse decat minimul necesar
 - datele pot fi accesate cu performanta acceptabila
- Baze de date relationale
 - model relational (matematic eficient) – Codd ~1970

DBMS, RDBMS

- DBMS – database management system aplicatii incluse in baza de date pentru accesul la informatii
- RDBMS – Relational DBMS. Majoritatea sistemelor de baze de date tind la aceasta titulatura
 - ~300 de reguli trebuie respectate
 - nici un sistem actual nu implementeaza total aceste reguli

Relatii

- Toate sistemele de baze de date sunt caracterizate de:
 - toate informatiile sunt reprezentate intr-o aranjare ordonata **bidimensionala** numita **relatie**
 - toate valorile (attribute) stocate sunt scalare (in orice celula din tabel se stocheaza **o singura** valoare)
 - toate operatiile se aplica asupra unei intregi relatii si rezulta o intreaga relatie
- Terminologii (**MySql**)
 - tabel – **table** / recordset / **result set**
 - linie – record / **row**
 - coloana – field / **column**

Relatii, chei

- toate informatiile sunt reprezentate intr-o aranjare bidimensionala numita relatie
 - aranzarile bidimensionale nu sunt ordonate implicit
 - datele trebuie stocate pentru a implementa o relatie in asa fel incat fiecare linie sa fie unica
- cheie candidata
 - exista cel putin o combinatie de attribute (coloane) care pot identifica in mod unic o linie
 - aceste combinatii de attribute se numesc chei candidate

Chei

- Din toate combinatiile de coloane care pot fi utilizate pentru identificarea unica a unei linii se alege **macar** una utilizata intern de RDBMS pentru ordonarea datelor – **cheie primara**
 - Celelalte chei candidate devin **chei alternative** si pot fi folosite pentru eficientizarea prelucrarilor (crearea de “index” dupa aceste chei)
- In cazul in care nu exista o combinatie de coloane utilizabila ca si cheie cu utilitate practica se introduce artificial o cheie, cu numere intregi incrementate automat de DBMS (autoincrement)
 - de multe ori este recomandata o astfel de actiune, numerele intregi fiind mult mai usor de controlat, ordonat, cautat decat alte tipuri de date
 - cheile de tip autoincrement nu e **nevoie** sa contina informatie

Normalizare

- Normalizarea asigura:
 - stocarea eficienta a datelor
 - prelucrarea eficienta a datelor
 - integritatea datelor
- Trei nivele de normalizare
- Eliminarea datelor redundante

14	Tofu	\$23.25

These are not the same value

Order ID	Product Name	Unit Price	Quantity	Unit Price
10248	Mozzarella di Giovanni	\$34.80	5	\$174.00
10248	Queso Cabrales	\$21.00	12	\$168.00
10248	Singaporean Hokkien Fried Mee	\$14.00	10	\$98.00
10249	Manjimup Dried Apples	\$53.00	40	\$1,696.00
10249	Tofu	\$23.25	9	\$167.40

Prima forma normala

- toate valorile sunt scalare

OrderID	CustomerID	OrderDate	Items	OrderTotal
1	CACTU	1/1/1999	3 Zaanse koeken, 1 Tarte au sucre	\$89.70
2	BSBEV	1/5/1999	4 Mozzarella di Giovanni	\$139.20
3	SUPRD	5/2/1999	3 Ravioli Angelo, 6 Tofu	\$198.06

- nu toate rezolvarile sunt eficiente

OrderID	CustomerID	Item1	Qty1	Item2	Qty2	Item3	Qty3
1	ANTON	Queso Cabrales	4	Tofu	3	Ravioli Angelo	1
2	BLAUS	Chai	2		0		

Product	Year	TargetJan	ActualJan	TargetFeb	ActualFeb
Aniseed Syrup	2004	\$1,000.00	\$1,300.00	\$0.00	\$0.00
Chai	2004	\$4,000.00	\$2,000.00	\$0.00	\$0.00
Chang	2004	\$3,000.00	\$8,022.00	\$0.00	\$0.00

A doua forma normala

- O relatie este in a **doua** forma normala cand este in **prima** forma normala si suplimentar attributele (valorile de pe coloana) depind de **intreaga cheie** candidata aleasa

Product Name	SupplierName	Category Name	SupplierPhoneNumber

MySql – Recapitulare rapida

Relatii in Bazele de date

Relatii in Bazele de date

- Respectarea formelor normale ale bazelor de date aduce nenumarate avantaje
- Efectul secundar este dat de necesitatea separarii datelor intre mai multe tabele
- In exemplul utilizat avem doua concepte diferite din punct de vedere logic
 - produs
 - categorie de produs

Relatii in Bazele de date

- Normalizarea bazei de date impune crearea a cel puțin doua tabele
 - produse
 - categorii
- Cele doua tabele nu sunt independente
- Intre ele exista o legatura data de functionalitatea dorita pentru aplicatie: **un produs va apartine unei anumite categorii de produse**

Relatii in Bazele de date

- Legaturile intre tabele pot fi
 - One to One
 - One to Many
 - Many to Many
 - Unare (auto referinta)

One to One

- Fiecare tabel poate avea corespondenta **o singura linie (row) sau nici una** de cealalta parte a relatiei
- echivalent cu o relatie “bijectiva”
- analogie cu casatorie:
 - o persoana poate fi casatorita sau nu
 - daca este casatorita va fi casatorita cu o singura persoana din tabelul cu persoane de sex opus
 - persoana respectiva va fi caracterizata de aceeasi relatie “one to one” – primeste simultan un singur corespondent in tabelul initial

One to One

- de multe ori legaturile "one to one" se bazeaza pe reguli externe
- de obicei se poate realiza usor si eficient gruparea ambelor tabele in unul singur

CUSTOMERS		
customer_id	customer_name	address_id
101	John Doe	301
102	Bruce Wayne	302

ADDRESSES	
address_id	address
301	12 Main St., Houston TX 77001
302	1007 Mountain Dr., Gotham NY 10286

CUSTOMERS		
customer_id	customer_name	customer_address
101	John Doe	12 Main St., Houston TX 77001
102	Bruce Wayne	1007 Mountain Dr., Gotham NY 10286

One to Many

- O linie dintr-un tabel (row), identificata prin cheia primara, poate avea: **nici una, una sau mai multe linii corespondente** in celalalt tabel. In acesta o linie poate fi legata cu o **singura** linie din tabelul primar.
- Analogie cu relatii parinte/copil:
 - fiecare om are o singura mama
 - fiecare femeie poate avea nici unul, unul sau mai multi copii

One to Many, Many to One

- de obicei aceste legaturi se implementeaza prin introducerea cheii primare din tabelul **One** in calitate de coloana in tabelul **Many** (cheie externa – foreign key)

CUSTOMERS	
customer_id	customer_name
101	John Doe
102	Bruce Wayne

ORDERS			
order_id	customer_id	order_date	amount
555	101	12/24/09	\$156.78
556	102	12/25/09	\$99.99
557	101	12/26/09	\$75.00

Many to Many

- Fiecare linie (row) din **ambele tabele** implicate in legatura poate fi legat cu **oricate (niciuna, una sau mai multe) linii** din tabelul corespondent.
- Analogie cu relatii de rudenie (veri de exemplu), tabel 1 – barbati, tabel 2 – femei :
 - fiecare barbat poate fi ruda cu una sau mai multe femei
 - la randul ei fiecare femeie poate fi ruda cu unul sau mai multi barbati

Many to Many

- de obicei aceste legaturi se implementeaza prin introducerea unui tabel **suplimentar** (numit tabel **asociat** sau de **legatura**) care sa memoreze legaturile

ORDERS				
order_id	customer_id	order_date	amount	
555	101	12/24/09	\$156.78	
556	102	12/25/09	\$99.99	
ITEMS				
item_id	item_name	item_description		
201	Tickle Me Elmo	It wants to be tickled		
202	District 9 DVD	Awesome sci-fi movie		
203	Batarang	It is very sharp		
ITEMS_ORDERS				
order_id	item_id			
555	201			
555	202			
556	202			
556	203			

Self Referencing (unare)

- Un caz particular de legatura "one to many" in care legatura e in interiorul aceluasi tabel
- rezolvarea este similara, introducerea unei coloane suplimentara, cu referinta la cheia primara din tabel
- analogie cu relatii parinte copil cand ambele persoane se regasesc in acelasi tabel

CUSTOMERS		
customer_id	customer_name	referrer_customer_id
101	John Doe	0
102	Bruce Wayne	101
103	James Smith	101

Relatii in Bazele de date

- Respectarea formelor normale ale bazelor de date aduce nenumarate avantaje
- Efectul secundar este dat de necesitatea separarii datelor intre mai multe tabele
- In exemplul utilizat avem doua concepte diferite din punct de vedere logic
 - produs
 - categorie de produs

Relatii in Bazele de date

- In exemplul utilizat avem doua concepte diferite din punct de vedere logic
 - produs
 - categorie de produs
- Cele doua tabele nu sunt independente
- Intre ele exista o legatura data de functionalitatea dorita pentru aplicatie: **un produs va apartine unei anumite categorii de produse**

Relatii in Bazele de date

- Legaturile implementata
 - One to Many
 - in tabelul "produse" apare cheia externa (foreign key): "id_categ"

Relatii in Bazele de date

- Daca se doreste o situatie cand un produs poate apartine **mai multor categorii** (o carte cu CD poate fi inclusa si in "papetarie" si in "audio-video")
 - relatia devine de tipul **Many to Many**
 - e necesara introducerea unui tabel de legatura cu coloanele "id_leg" (cheie primara), "id_categorie" si "id_produs" (chei externe)

Relatii in Bazele de date

Relatii

- **Nu** trebuie evitate relatiile
 - Many to Many
 - One to Many
- Prelucrarea cade in sarcina server-ului de baze de date (**RDBMS**)
 - JOIN – **esential** in aplicatii cu baze de date

MySql – eficienta

- eficienta unei aplicatii web
 - 100% - **toate prelucrarile "mutate" in RDBMS**
 - PHP **doar** afisarea datelor
- eficienta unei aplicatii MySql
 - 25% **alegerea corecta a tipurilor de date**
 - 25% **crearea indecsilor necesari in aplicatii**
 - 25% **normalizarea corecta a bazei de date**
 - 20% **cresterea complexitatii interogarilor pentru a "muta" prelucrarile pe server-ul de baze de date**
 - 5% **scrierea corecta a interogarilor**

Acces la server-ul MySql din PHP

Acces la server-ul MySQL din PHP

- Bibliotecile corespunzatoare trebuie activate in php.ini – vezi laboratorul 1.
 - mysql
 - mysqli (improved accesul la functionalitati ulterioare MySQL 4.1)
- O baza de date existenta poate fi accesata daca exista un utilizator cunoscut in PHP cu drepturi de acces corespunzatoare – vezi laboratorul 1.
- O baza de date poate fi creata si din PHP dar nu e metoda recomandata daca nu e necesara
 - cod dificil de implementat pentru o **singura** utilizare
 - necesita existenta unui utilizatori cu drepturi mai mari pentru crearea bazei de date si alocarea de drepturi unui utilizator restrans

Funcții PHP de acces MySQL

- `mysql_query`
 - trimiterea unei interogari SQL spre server
 - resource `mysql_query` (string query [, resource link_identifier])
 - rezultatul
 - SELECT, SHOW, DESCRIBE sau EXPLAIN – resursa (tabel)
 - UPDATE, DELETE, DROP, etc – true/false
- `mysql_fetch_assoc`
 - returneaza o **matrice asociativa** corespunzatoare liniei de la indexul intern (indecsi de tip sir corespunzatori denumirii coloanelor – field – din tabelul de date) si incrementeaza indexul intern sau **false** daca nu mai sunt linii
 - array `mysql_fetch_assoc` (resource result)

Functii PHP de acces MySql

Parcurgerea resurselor rezultat

- `mysql_fetch_assoc`
 - returneaza o **matrice asociativa** corespunzatoare liniei de la indexul intern (indecsi de tip sir corespunzatori denumirii coloanelor – field – din tabelul de date) si incrementeaza indexul intern sau **false** daca nu mai sunt linii
 - array `mysql_fetch_assoc` (resource result)
- `mysql_fetch_row`
 - returneaza o matrice cu indecsi intregi
 - array `mysql_fetch_row` (resource result)

Funcții PHP de acces MySQL

Parcurgerea resurselor rezultat

- `mysql_fetch_array`
 - grupează funcționalitatea `mysql_fetch_assoc` și `mysql_fetch_row`
 - array `mysql_fetch_array` (resource result [, int result_type])
 - `MYSQL_ASSOC`, `MYSQL_NUM`, `MYSQL_BOTH` (implicit)
- `mysql_data_seek`
 - muta indexul intern la valoarea indicată
 - bool `mysql_data_seek` (resource result, int row_number)

Resurse MySQL

- Resursele reprezinta o combinatie intre
 - date structurate (valori + structura) rezultate in urma unor interogari SQL
 - functii de acces la aceste date/structuri
- Analogie cu POO
 - o "clasa speciala" creata in urma interogarii cu functii predefinite de acces la datele respective

Resurse MySQL

Structura

Index intern	Col 1 (tip date)	Col 2 (tip date)
1			
2			
...			

Date

Index intern	Col 1	Col 2
1	Val 11	Val 12	...
2	Val 21	Val 22	...
...

Functii de acces la structura

Functii de acces la date

~~Acces direct~~

Resurse MySQL

- Functiile de acces la structura sunt rareori utilizate
 - majoritatea aplicatiilor sunt concepute pe structura fixa, si cunosc structura datelor primite
 - exceptie: aplicatii generale, ex.: PhpMyAdmin
- Majoritatea functiilor de acces la date sunt caracterizate de acces secvential
 - se citesc in intregime valorile stocate pe o linie
 - simultan se avanseaza indexul intern pe urmatoarea pozitie, pregatindu-se urmatoarea citire

Resurse MySQL

- Functiile sunt optimizate pentru utilizarea lor intr-o structura de control **do {} while()**, sau **while() {}** de control
 - returneaza FALSE cand "s-a ajuns la capat"
- tipic se realizeaza o citire (mysql_fetch_assoc) urmata de o bucla **do {} while()**
 - pentru a se putea introduce cod de detectie probleme rulat o singura data

Exemplu de utilizare

```
$hostname = "localhost";  
$database = "world";  
$username = "web";  
$password = "ceva";  
$conex= mysql_connect($hostname, $username, $password);  
mysql_select_db($database, $conex);
```

```
$query = "SELECT `Code`, `Name`, `Population` FROM `country` AS c ";  
$result = mysql_query($ query, $conex) or die(mysql_error());  
$row_result = mysql_fetch_assoc($ result );  
$totalRows_result = mysql_num_rows($ result );
```

Exemplu de utilizare

```
<?php
do {?>
<tr>
    <td><?php echo $index; ?>&nbsp;  </td>
    <td><?php echo $ row_result ['Code']; ?>&nbsp;  </td>
    <td><?php echo $ row_result ['Name']; ?>&nbsp;  </td>
    <td><?php echo $ row_result ['Population']; ?>&nbsp;  </td>
</tr>
<?php
    $index++;
}
while ($ row_result = mysql_fetch_assoc($ result )); ?>
```

Modificari laborator cu date stocate text

- Codul aplicatiei ramane in mare parte acelasi
- Se modifica doar citirea valorilor pentru popularea matricii \$produse ("antet.php")

```
$matr=file("produse.txt");  
foreach ($matr as $linie)  
    {  
        $valori=explode("\t",$linie,5);  
        $produse[$valori[0]] [$valori[1]]=array ("descr" => $valori[2], "pret" => $valori[3], "cant" =>  
$valori[4]);  
    }
```

Modificari laborator cu date stocate XML

XML

```
$xml = simplexml_load_file("lista.xml");
if ($xml)
{
foreach ($xml->categorie as $categorie)
    {
    $produse[(string)$categorie["nume"]]=array();
    foreach ($categorie->produs as $prod_cur)
        {
        $produse[(string)$categorie["nume"]][(string)$prod_cur->nume]=array
("descr" => (string)$prod_cur->desc, "pret" => (string)$prod_cur->pret,
"cant" => (string)$prod_cur->cant);
        }
    }
}
```

Modificari laborator cu date stocate

MySQL

```
$hostname = "localhost";
$database = "tmpaw";
$username = "web";
$password = "test";
$conex= mysql_connect($hostname, $username, $password);
mysql_select_db($database, $conex);
$query = "SELECT * FROM `categorii` AS c";
$result_c = mysql_query($query, $conex) or die(mysql_error());
$row_result_c = mysql_fetch_assoc($result_c);
$totalRows_result = mysql_num_rows($result_c);
do {
    $query = "SELECT * FROM `produse` AS p WHERE `id_categ` = ".$row_result_c['id_categ'];
    $result_p = mysql_query($query, $conex) or die(mysql_error());
    $row_result_p = mysql_fetch_assoc($result_p);
    $totalRows_result = mysql_num_rows($result_p);
    $produse[$row_result_c['nume']] = array();
    do {
        $produse[$row_result_c['nume']][$row_result_p['nume']] = array ("descr" =>
$row_result_p['detalii'], "pret" => $row_result_p['pret'], "cant" => $row_result_p['cant']);
    }
    while ($row_result_p = mysql_fetch_assoc($result_p));
}
while ($row_result_c = mysql_fetch_assoc($result_c));
```

MySQL – eficienta

- eficienta unei aplicatii web
 - 100% - **toate prelucrarile "mutate" in RDBMS**
 - PHP **doar** afisarea datelor
- eficienta unei aplicatii MySQL
 - 25% **alegerea corecta a tipurilor de date**
 - 25% **crearea indecsilor necesari in aplicatii**
 - 25% **normalizarea corecta a bazei de date**
 - 20% **cresterea complexitatii interogarilor pentru a "muta" prelucrarile pe server-ul de baze de date**
 - 5% **scrierea corecta a interogarilor**

Optimizare

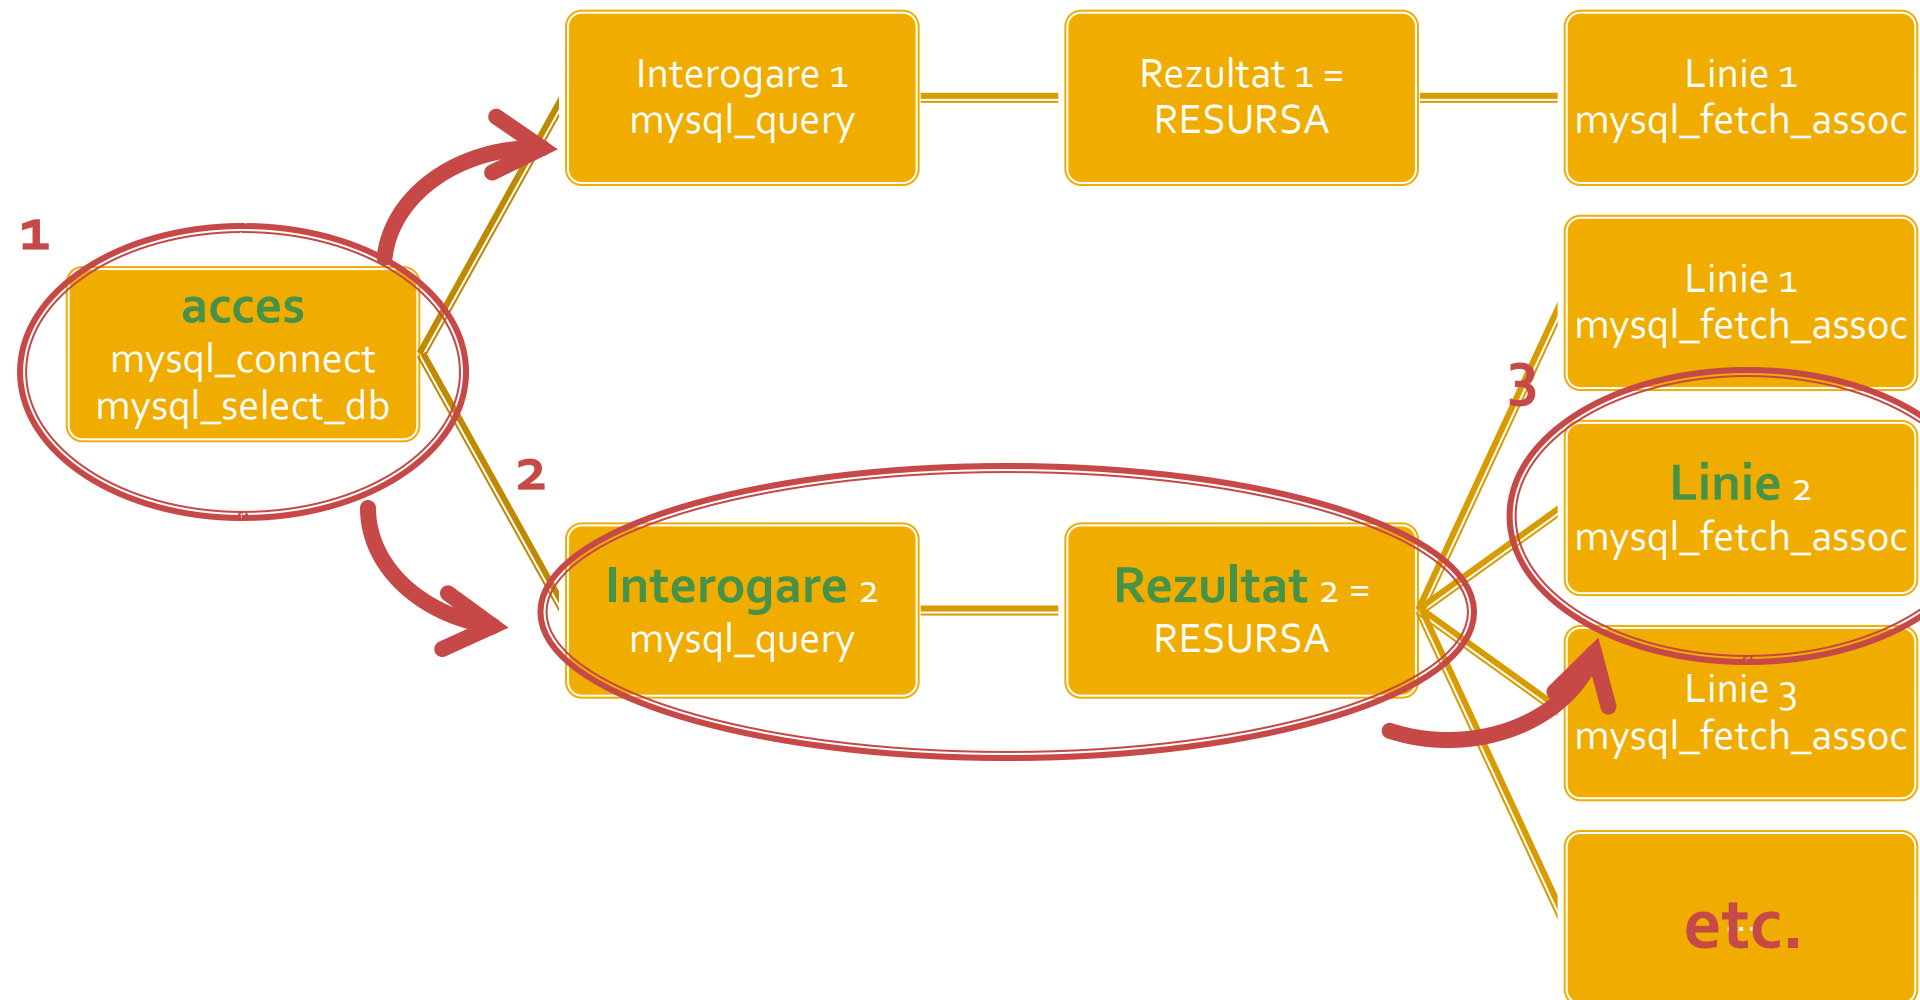

- o singura interogare SQL, unirea tabelelor lasata in baza server-ului MySQL

```
$hostname = "localhost";
$database = "tmpaw";
$username = "web";
$password = "test";
$conex= mysql_connect($hostname, $username, $password);
mysql_select_db($database, $conex);

$query = "SELECT p.*, c.`nume` AS `nume_categ` FROM `produse` AS p
        LEFT JOIN `categorii` AS c ON (c.`id_categ` = p.`id_categ`)";
$result = mysql_query($query, $conex) or die(mysql_error());
$row_result = mysql_fetch_assoc($result);
$totalRows_result = mysql_num_rows($result);

do{
    $produse[$row_result['nume_categ']][$row_result['nume']] = array ("descr" => $row_result['detalii'], "pret"
=> $row_result['pret'], "cant" => $row_result['cant']);
}
while ($row_result = mysql_fetch_assoc($result));
```

Functii de acces la server-ul MySQL

!! IMPORTANT

PHP > 5.5

PHP 5.5

- Incapand cu versiunea 5.5 a PHP extensia mysql este declarata **depreciata**
 - orice utilizare a unei functii genereaza eroare de tip **E_DEPRECATED**
 - se preconizeaza ca in PHP > 6 aceasta extensie va fi eliminata total
- Alternativele de utilizare sunt
 - extensia mysqli (MySQL Improved)
 - extensia PDO (PHP Data Objects)

Extensia mysqli

- Inafara securitatii sporite ofera acces la facilitatile curente ale server-ului MySQL
 - accesul la interogari predefinite (Prepared Statements) (viteza, securitate)
 - server side
 - client side
 - proceduri stocate pe server (viteza, securitate)
 - interogari multiple
 - tranzactii (integritate)

Extensia mysqli

- Doua modalitati de utilizare
 - procedurala (similar mysql)
 - POO (similar PDO)
- Utilizarea procedurala (aproape) similara cu utilizarea extensiei originale mysql
 - tranzitie facila
 - tranzitie cu mici diferente de parametri

mysqli – Procedural

```
<?php
$mysqli = mysqli_connect("example.com", "user", "password", "database");
$res = mysqli_query($mysqli, "SELECT 'Please do not use the mysql extension ' AS _msg FROM DUAL");
$row = mysqli_fetch_assoc($res);
echo $row['_msg'];

$mysqli = mysqli_connect("example.com", "user", "password");
mysqli_select_db("test");
$res = mysqli_query("SELECT ' for new developments.' AS _msg FROM DUAL", $mysqli);
$row = mysqli_fetch_assoc($res);
echo $row['_msg'];
?>
```

- toate functiile mysql au un echivalent mysqli
- majoritatea functiilor au aceeasi parametri in aceeasi ordine
- sunt totusi functii cu mici diferente (Ex: **mysqli_connect**, **mysqli_query**)

mysqli – Programare orientata obiect

```
<?php
$var = new mysqli("example.com", "user", "password", "database");
$res = $var->query ($mysqli, "SELECT 'Please do not use the mysql extension ' AS _msg FROM DUAL");
$row = $res->fetch_assoc();
echo $row['_msg'];

$mysqli = mysqli_connect("example.com", "user", "password");
mysqli_select_db("test");
$res = mysqli_query("SELECT ' for new developments.' AS _msg FROM DUAL", $mysqli);
$row = mysqli_fetch_assoc($res);
echo $row['_msg'];
?>
```

Resurse MySQL – mysqli

Functii de acces la structura

Functii de acces la date

Acces direct

Metode atasate resursei

MySql – Server Windows 2000

Mini – Indrumar practic Lucru cu bazele de date

Realizarea bazei de date

- Se recomanda utilizarea utilitarului **MySQL Query Browser** sau un altul echivalent pentru crearea scheletului de baza de date (detalii – laborator 1)
- Se initializeaza aplicatia cu drepturi depline (“root” si parola)
 - se creaza o noua baza de date:
 - in lista “Schemata” – Right click – Create New Schema
 - se activeaza ca baza de date curenta noua “schema” – Dublu click pe numele ales

Introducere tabele

- Introducere tabel – Click dreapta pe numele bazei de date aleasa – Create New Table
- se defineste structura tabelului
 - nume coloane
 - tip de date
 - NOT NULL – daca se accepta ca acea coloana sa ramana fara date (NULL) sau nu
 - AUTOINC – daca acea coloana va fi de tip intreg si va fi incrementata automat de server (util pentru crearea cheilor primare)
 - Default value – valoarea implicita care va fi inserata daca la introducerea unei linii noi nu se mentioneaza valoare pentru acea coloana (legat de optiunea NOT NULL)

Tabel Categorii

The screenshot shows the MySQL Table Editor interface for a table named 'categorii' in the 'tmpaw' database. The table has three columns: 'id_categ' (INT(10), UNSIGNED, ZEROFILL, NULL), 'nume' (VARCHAR(45), BINARY, NULL), and 'detalii' (VARCHAR(150), BINARY, NULL). A primary index is defined on the 'id_categ' column, with the index name 'PRIMARY', index kind 'PRIMARY', and index type 'BTREE'.

Table Name: categorii Database: tmpaw Comment: InnoDB free: 11264 kB

Tabel Prognose

The screenshot displays the MySQL Table Editor interface for a table named 'produse' in the 'tmpaw' database. The table has a comment 'InnoDB free: 11264 kB'. The 'Columns and Indices' tab is active, showing the following table structure:

Column Name	Datatype	NOT NULL	AUTO INC	Flags	Default Value	Comment
id_produkt	INT(10)	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/> UNSIGNED <input type="checkbox"/> ZEROFILL	NULL	
id_kategori	INT(10)	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/> UNSIGNED <input type="checkbox"/> ZEROFILL		
name	VARCHAR(45)	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/> BINARY		
detail	VARCHAR(150)	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/> BINARY	NULL	
cant	INT(10)	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/> UNSIGNED <input type="checkbox"/> ZEROFILL	NULL	
pret	FLOAT	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/> UNSIGNED <input type="checkbox"/> ZEROFILL	NULL	

The 'Indices' tab is also active, showing a PRIMARY index on the 'id_produkt' column. The index settings are:

- Index Name: PRIMARY
- Index Kind: PRIMARY
- Index Type: BTREE
- Index Columns: id_produkt

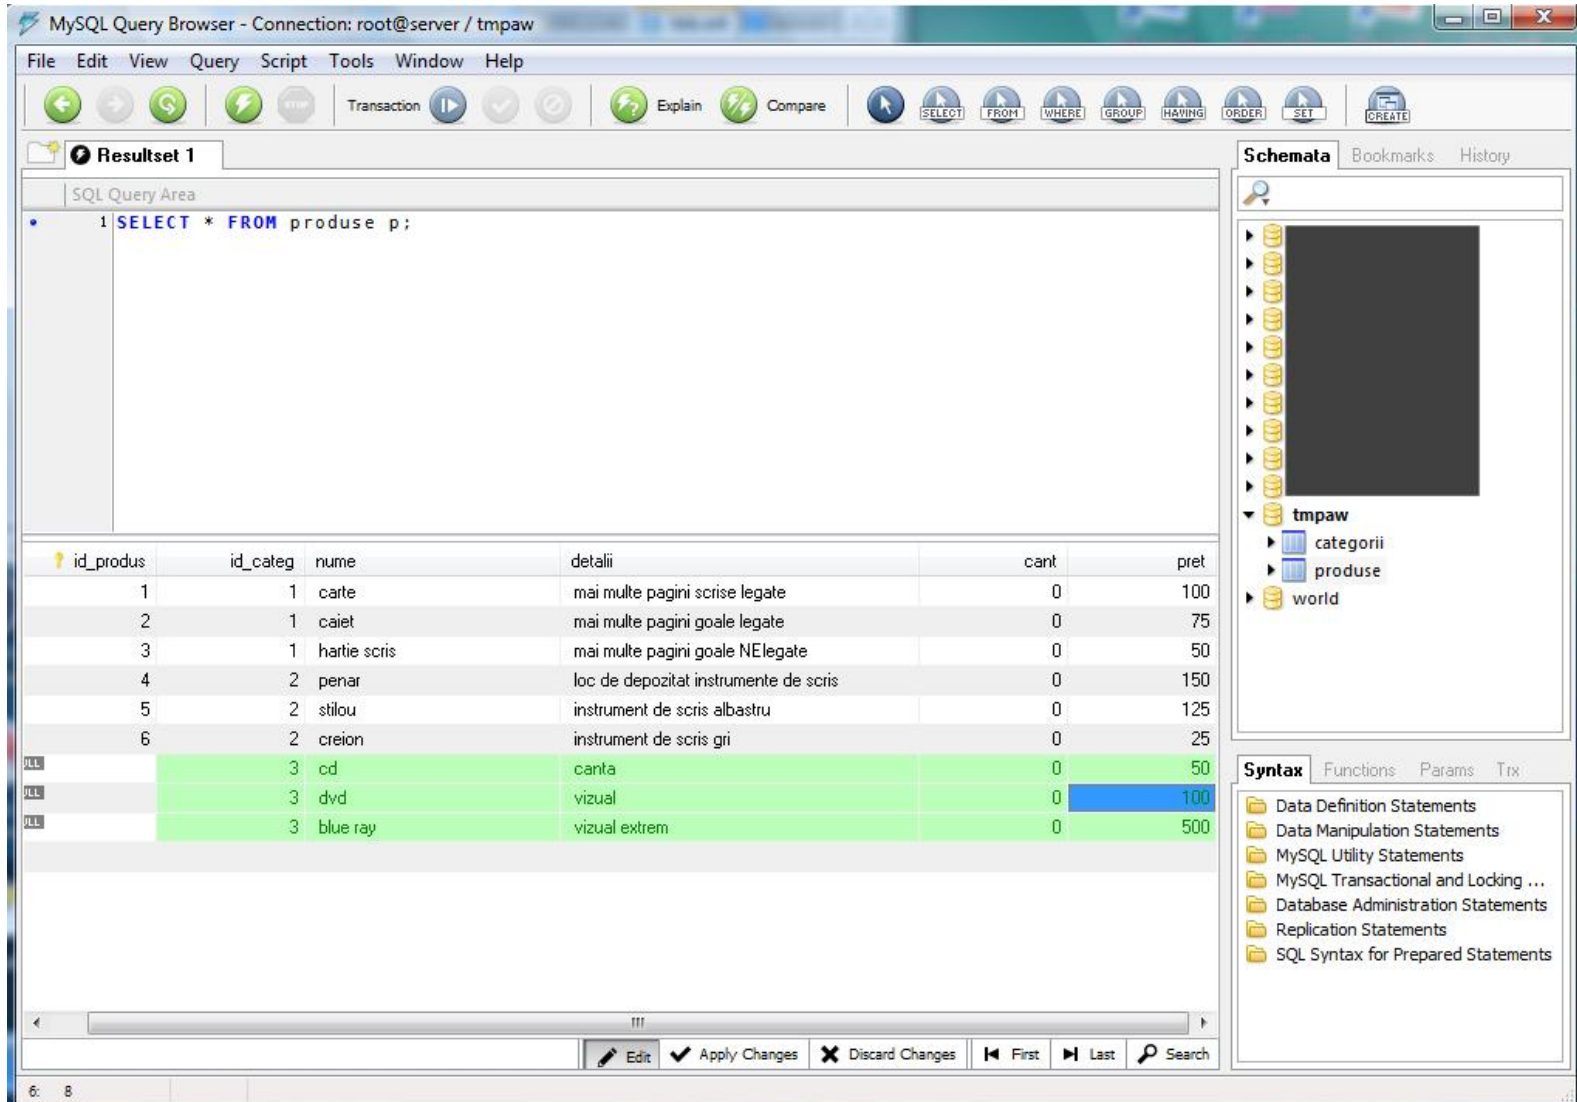

The background shows the MySQL Query Browser interface with a resultset table containing 9 rows of data for 'id_produkt' and 'id_kategori'.

Introducere date initiale

- Dublu click pe tabel → In zona "SQL Query Area" se completeaza interogarea de selectie totala
 - `SELECT * FROM produse p;`
- Executia interogarii SQL
 - Meniu → Query → Execute
 - Bara de butoane 
- Lista rezultata
 - initial vida
 - poate fi editata – butoanele "Edit", "Apply Changes", "Discard Changes" din partea de jos a listei

Introducere date initiale

The screenshot displays the MySQL Query Browser interface. The main window shows a query result set for the 'produse' table. The query executed is 'SELECT * FROM produse p;'. The result set contains 9 rows of data, with columns: id_produc, id_categ, nume, detalii, cant, and pret. The rows are as follows:

id_produc	id_categ	nume	detalii	cant	pret
1	1	carte	mai multe pagini scrise legate	0	100
2	1	caiet	mai multe pagini goale legate	0	75
3	1	hartie scris	mai multe pagini goale NElegate	0	50
4	2	penar	loc de depozitat instrumente de scris	0	150
5	2	stilou	instrument de scris albastru	0	125
6	2	creion	instrument de scris gri	0	25
ALL	3	cd	canta	0	50
ALL	3	dvd	vizual	0	100
ALL	3	blue ray	vizual extrem	0	500

The interface also shows a 'Schemata' panel on the right, displaying the database structure with 'tmpaw' as the selected database, containing 'categorii' and 'produse' tables. The 'Syntax' panel at the bottom right lists various SQL statement categories.

Backup, Restore, drepturi de acces

- Se recomanda utilizarea utilitarului **MySQL Administrator** sau un altul echivalent (detalii – laborator 1)
- Se initializeaza aplicatia cu drepturi depline (“root” si parola)
- Se creaza un utilizator limitat (detalii – laborator 1)
- Se aloca drepturile “SELECT” + “INSERT” + “UPDATE” asupra bazei de date create (sau mai multe daca aplicatia o cere)

Drepturi de acces

Backup

The screenshot shows the MySQL Administrator interface for configuring a backup project. The window title is "MySQL Administrator - Connection: root@server". The main area is titled "Backup Project" and has three tabs: "Backup Project", "Advanced Options", and "Schedule".

General

Project Name: Name for this backup project.

Schemata

The Schemata list on the left includes: school, tmpaw, and world. The tmpaw schema is selected and highlighted in blue. A yellow arrow points from the "Backup" icon in the left sidebar to this schema.

Backup Content

Data directory	Obj...	Rows	Data ...	Last update
<input checked="" type="checkbox"/> tmpaw				
<input checked="" type="checkbox"/> categorii	Inno...	3	16384	
<input checked="" type="checkbox"/> produse	Inno...	9	16384	

A yellow arrow points from the "tmpaw" schema in the Schemata list to the "tmpaw" directory in the Backup Content table. Another yellow arrow points from the "tmpaw" directory in the Backup Content table to the "Execute Backup Now" button at the bottom right.

Buttons: New Project, Save Project, Execute Backup Now

Restaurarea bazei de date

- Din **MySql Administrator**
 - Sectiunea Restore → "Open Backup File"
- Din **MySql Query Browser**
 - Meniu → File → Open Script
 - Executie script SQL
 - Meniu → Script → Execute
 - Bara de butoane 
- Scriptul SQL rezultat contine comenzile/interogariile SQL necesare pentru crearea bazei de date si popularea ei cu date

Script SQL Backup - utilitate

- Poate fi folosit ca un model extrem de bun pentru comenzile necesare pentru crearea programatica (din PHP de exemplu) a bazei de date

```
CREATE DATABASE IF NOT EXISTS tmpaw;  
USE tmpaw;
```

```
DROP TABLE IF EXISTS `categorii`;  
CREATE TABLE `categorii` (  
  `id_categ` int(10) unsigned NOT NULL auto_increment,  
  `nume` varchar(45) NOT NULL,  
  `detalii` varchar(150) default NULL,  
  PRIMARY KEY (`id_categ`)  
) ENGINE=InnoDB DEFAULT CHARSET=latin1;
```

```
INSERT INTO `categorii` (`id_categ`,`nume`,`detalii`) VALUES  
(1,'papetarie',NULL),  
(2,'instrumente',NULL),  
(3,'audio-video',NULL);
```

PhpMyAdmin

The screenshot displays the phpMyAdmin web interface in a browser window. The address bar shows the URL `http://192.168.0.50/phpmyadmin/#PMAURL-0:index.php` and the server name `192.168.0.50 / localhost | ph...`. The interface includes a navigation menu on the left with options like 'Databases', 'SQL', 'Status', 'Users', 'Export', 'Import', 'Settings', 'Replication', 'Variables', 'Charsets', and 'Engines'. The main content area is divided into several panels:

- General Settings:** Includes a 'Change password' link and a 'Server connection collation' dropdown menu set to `utf8mb4_unicode_ci`.
- Appearance Settings:** Includes a 'Language' dropdown set to 'English', a 'Theme' dropdown set to 'pmahomme', and a 'Font size' dropdown set to '82%'. A 'More settings' link is also present.
- Database server:** Lists server details: Server: Localhost via UNIX socket, Server type: MariaDB, Server version: 5.5.44-MariaDB - MariaDB Server, Protocol version: 10, User: root@localhost, and Server charset: UTF-8 Unicode (utf8).
- Web server:** Lists web server details: Apache/2.4.6 (CentOS) OpenSSL/1.0.1e-fips mod_fcgid/2.3.9, PHP/5.4.16 mod_python/3.5.0- Python/2.7.5, Database client version: libmysql - 5.5.44-MariaDB, PHP extension: mysqli, and PHP version: 5.4.16.
- phpMyAdmin:** Lists version information: 4.4.15.1, and links to Documentation, Wiki, Official Homepage, Contribute, Get support, and List of changes.

The left sidebar shows a tree view of databases: 'New', 'information_schema', 'mysql', 'performance_schema', and 'world'.

Creare Baza de Date

- Databases → "nume" → Create

The screenshot shows the phpMyAdmin interface. The 'Databases' tab is selected and circled in red. Below it, the 'Create database' form is visible, with the database name 'tmpaw' entered in the text box, circled in red. The 'Collation' dropdown menu is set to 'utf8_general_ci' and is also circled in red. The 'Create' button is circled in red. A table below the form lists existing databases and their collations.

Database	Collation	
<input type="checkbox"/> information_schema	utf8_general_ci	Check Privileges
<input type="checkbox"/> mysql	latin1_swedish_ci	Check Privileges
<input type="checkbox"/> performance_schema	utf8_general_ci	Check Privileges
<input type="checkbox"/> world	latin1_swedish_ci	Check Privileges

Introducere coloane

- (eventual) NOT NULL / Index / Auto Increment
 - in functie de “necesitatile” coloanei respective

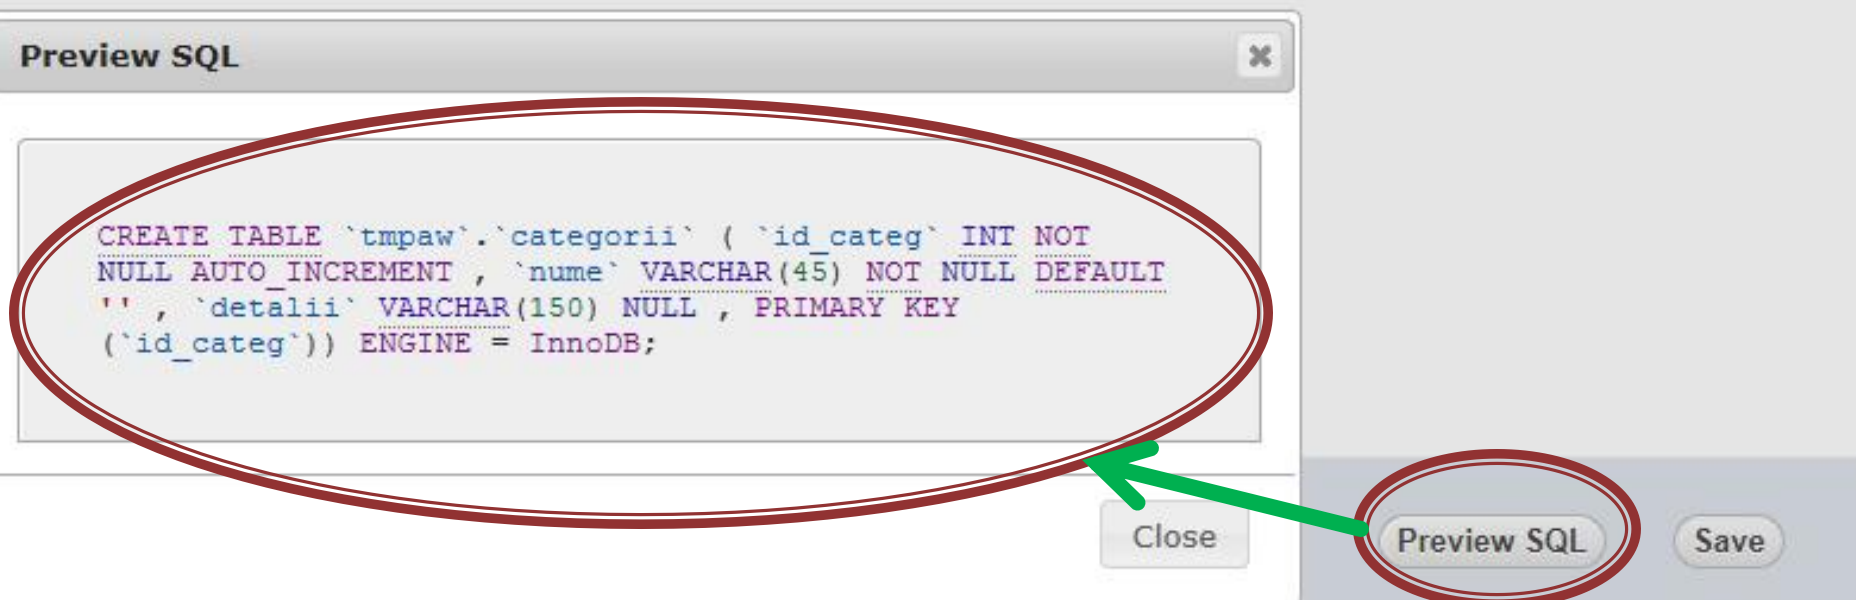

Table name: Add column(s)

Structure

Name	Type	Length/Values	Default	Collation	Attributes	Null	Index	A_I	Comments
id_categ	INT		None			<input type="checkbox"/>	PRIMARY	<input checked="" type="checkbox"/>	
nume	VARCHAR	45	As defined:			<input type="checkbox"/>	---	<input type="checkbox"/>	
detalii	VARCHAR	150	None			<input checked="" type="checkbox"/>	---	<input type="checkbox"/>	

Preview SQL

- in aproape toate etapele in PhpMyAdmin
 - exemplu de cod SQL/schelet utilizabil (copy/paste) in aplicatia PHP
 - modificari de finete absente din interfata
 - copy → Sectiune "SQL" in interfata → paste → modificare

Introducere coloane, tabel produse

- New → Nume → Add Columns → ...

The screenshot shows the phpMyAdmin interface for a database named 'tmpaw'. The 'Table name' field contains 'produse'. The 'Add' button is highlighted with a red circle, and the 'Go' button is also highlighted with a red circle. The 'Structure' tab is active, showing a table with columns: id_produs (INT, PRIMARY), id_categ (INT), nume (VARCHAR, 45), detalii (VARCHAR, 150), cant (INT), and pret (FLOAT). The 'New' button in the left sidebar is also highlighted with a red circle.

Name	Type	Length/Values	Default	Collation	Attributes	Null	Index	A_I	C
id_produs	INT		None			<input type="checkbox"/>	PRIMARY	<input checked="" type="checkbox"/>	
id_categ	INT		None			<input type="checkbox"/>	---	<input type="checkbox"/>	
nume	VARCHAR	45	As defined:			<input type="checkbox"/>	---	<input type="checkbox"/>	
detalii	VARCHAR	150	None			<input checked="" type="checkbox"/>	---	<input type="checkbox"/>	
cant	INT		None			<input checked="" type="checkbox"/>	---	<input type="checkbox"/>	
pret	FLOAT		None			<input checked="" type="checkbox"/>	---	<input type="checkbox"/>	

Introducere date initiale (interfata)

- Tabel → Insert → Completare → Go

The screenshot displays the phpMyAdmin interface for a MySQL database named 'tmpaw'. The current table is 'categorii'. The 'Insert' tab is selected, and the 'Insert as new row' option is chosen. The 'and then' dropdown is set to 'Go back to previous page'. The 'Continue insertion with' dropdown is set to '1 row'. The 'Go' button is highlighted. The table structure is as follows:

Column	Type	Function	Null	Values
id_categ	int(11)			
nume	varchar(45)			papetarie
detalii	varchar(150)		☑	

Vizualizare date existente

- Tabel → Browse → salt la pagina (numar de linii pe pagina)

The screenshot shows the phpMyAdmin interface for a database named 'tmpaw'. The 'categoriasii' table is selected, and the 'Browse' view is active. The table structure is as follows:

id_categ	nume	detalii
1	papetarie	NULL
2	instrumente	NULL
3	audio-video	NULL

The 'Browse' view shows 3 rows, with the first three rows circled in red. The 'Query results operations' section at the bottom includes options for Print view, Export, Display chart, and Create view.

Introducere date initiale (SQL)

- Tabel → SQL → completare → Go

The screenshot shows the phpMyAdmin interface with the following elements:

- Navigation Panel (Left):** Shows a tree view of databases. The 'tmpaw' database is selected, and the 'produse' table is highlighted.
- SQL Tab:** The 'SQL' tab is active, showing an SQL query:

```
1 INSERT INTO `produse` (`id_produc`, `id_categ`, `nume`, `detalii`, `cant`, `pret`)
2 VALUES
3 (1,1,'carte','mai multe pagini scrise legate',0,100),
4 (2,1,'caiet','mai multe pagini goale legate',0,75),
5 (3,1,'hartie scris','mai multe pagini goale NElegate',0,50),
6 (4,2,'penar','loc de depozitat instrumente de scris',0,150),
7 (5,2,'stilou','instrument de scris albastru',0,125),
8 (6,2,'creion','instrument de scris gri',0,25),
9 (7,3,'cd','canta',0,50),
10 (8,3,'dvd','vizual',0,100),
11 (9,3,'blue ray','vizual extrem',0,500);
```
- Buttons:** Below the query are buttons for 'SELECT *', 'SELECT', 'INSERT', 'UPDATE', 'DELETE', 'Clear', and 'Format'. The 'Go' button is highlighted in the bottom right corner.
- Columns Panel (Right):** Lists the columns of the 'produse' table: 'id_produc', 'id_categ', 'nume', 'detalii', 'cant', and 'pret'.
- Footer:** Shows options for the query execution: '[Delimiter :]', 'Show this query here again' (checked), 'Retain query box' (unchecked), and 'Rollback when finished' (unchecked).

Tabel produse

The screenshot shows the phpMyAdmin interface for a database named 'tmpaw'. The 'Table: produse' view is active, showing the table structure and data. The 'Structure' tab is selected, and the 'produse' table is highlighted in the left sidebar. The table contains 9 rows of data, including columns for 'id_produs', 'id_categ', 'nume', 'detalii', 'cant', and 'pret'.

Showing rows 0 - 8 (9 total, Query took 0.0003 seconds.)

```
SELECT * FROM `produse`
```

Index

- Adaugare index e esentiala pentru viteza
 - exemplu, produse grupate pe categorii, selectia produselor dintr-o categorie se face cu :
 - `SELECT * FROM `produse` WHERE `id_categ` = 1`
- Tabel → Structure → Index / Selectare + Index

The screenshot shows the phpMyAdmin interface for a database named 'tmpaw'. The 'Table: produse' view is active, showing the table structure. The 'Structure' tab is selected, and the 'Index' sub-tab is also selected. The table structure is as follows:

#	Name	Type	Collation	Attributes	Null	Default	Extra	Action
1	id_produs	int(11)			No	None	AUTO_INCREMENT	Change Drop Primary Unique Index Spatial Fulltext Distinct values
2	id_categ	int(11)			No	None		Change Drop Primary Unique Index Spatial Fulltext Distinct values
3	nume	varchar(45)	utf8_general_ci		No			Change Drop Primary Unique Index Spatial Fulltext Distinct values
4	detalii	varchar(150)	utf8_general_ci		Yes	NULL		Change Drop Primary Unique Index Spatial Fulltext Distinct values
5	cant	int(11)			Yes	NULL		Change Drop Primary Unique Index Spatial Fulltext Distinct values
6	pret	float			Yes	NULL		Change Drop Primary Unique Index Spatial Fulltext Distinct values

The 'Index' tab is selected, showing the following index:

Index name	Index type	Index columns
PRIMARY	PRIMARY	id_categ

The 'Index' tab is also selected in the bottom toolbar. The 'id_categ' column is highlighted in the table structure, and the 'Index' button in the bottom toolbar is also highlighted.

Verificare/Stergere index

- Apasare +Indexes, se deschide lista de indecsi
- Apasare -Indexes, se inchide lista de indecsi

- Indexes

Indexes ⓘ

Action	Keyname	Type	Unique	Packed	Column	Cardinality	Collation	Null	Comment
 Edit  Drop PRIMARY		BTREE	Yes	No	id_produ	9	A	No	
 Edit  Drop id_categ		BTREE	No	No	id_categ	9	A	No	

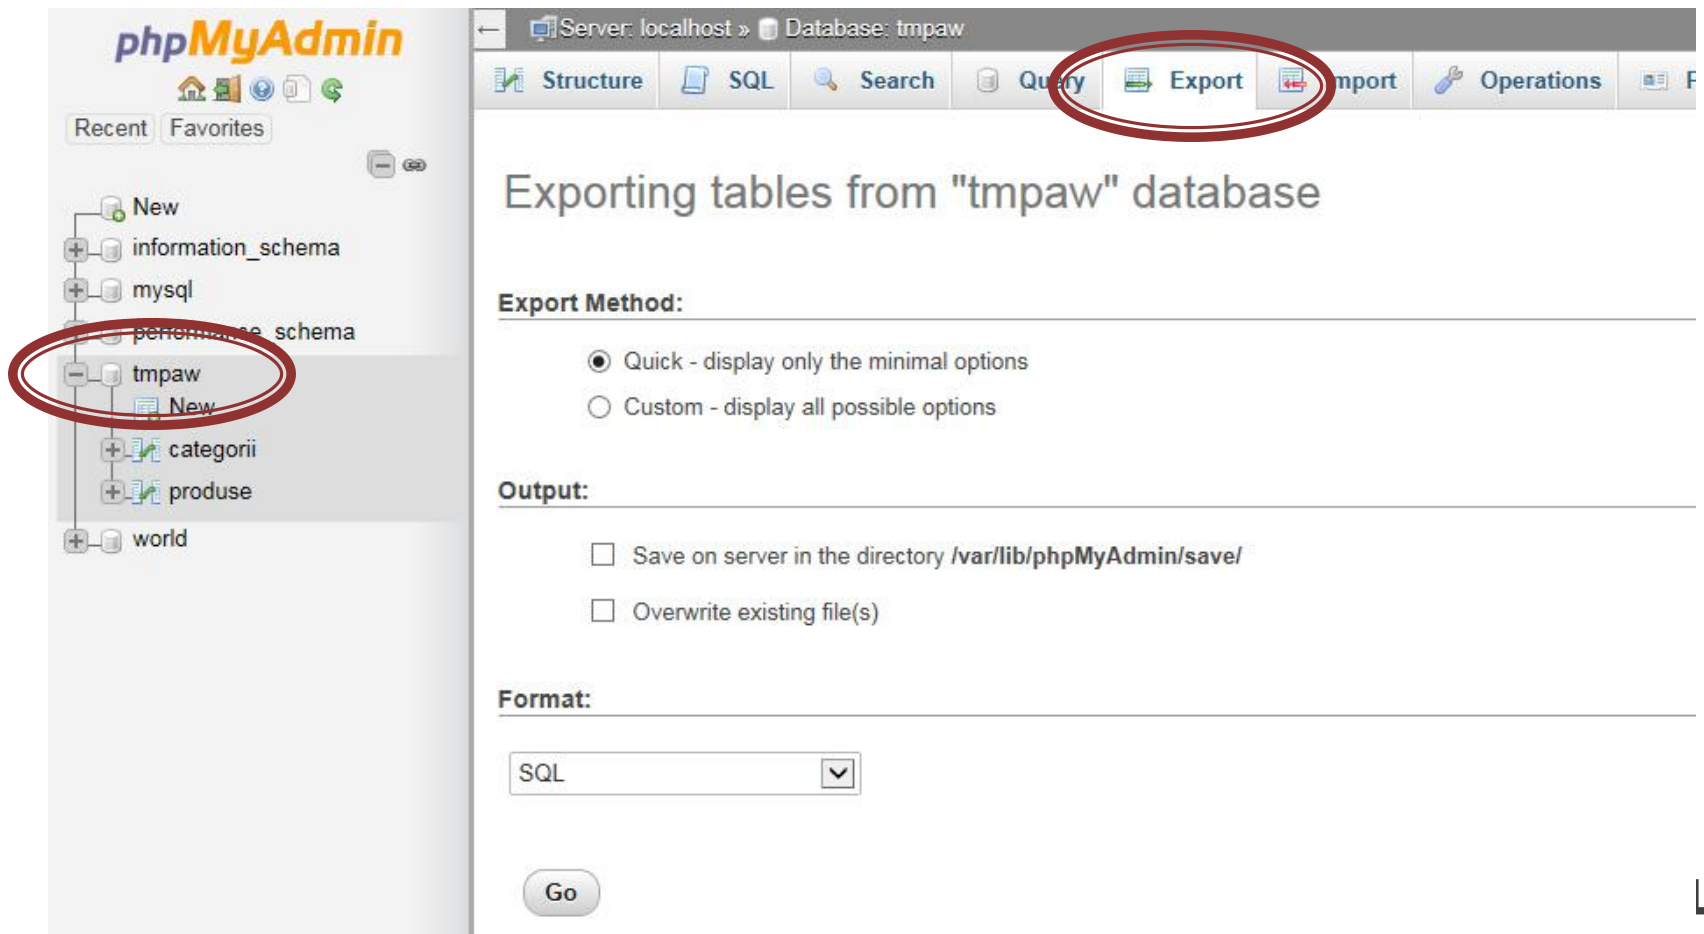

Create an index on columns

Backup, Restore

- Ca și în cazul Windows 2000 facilitatea de Backup realizează un script SQL care conține structura și datele exprimate sub forma de interogări SQL
- O deosebire între PhpMyAdmin și aplicațiile specifice MySQL (aceleși de pe Windows 2000 sau MySQL Workbench) este absența liniilor de creare a bazei de date
 - CREATE DATABASE IF NOT EXISTS tmpaw;
 - USE tmpaw;
- La utilizarea PhpMyAdmin trebuie să se creeze manual înaintea restaurării baza de date

Backup

- Nume (tabel sau baza de date) → Export

The screenshot displays the phpMyAdmin interface. On the left sidebar, the 'tmpaw' database is selected and circled in red. The main toolbar at the top features several icons, with 'Export' and 'Import' also circled in red. The central panel shows the 'Exporting tables from "tmpaw" database' dialog. Under 'Export Method', the 'Quick' option is selected. Under 'Output', the 'Save on server' and 'Overwrite existing file(s)' options are unchecked. Under 'Format', 'SQL' is selected in the dropdown menu. A 'Go' button is located at the bottom of the dialog.

Restore

- Se creaza in avans baza de date
- Nume → Import → Browse (alegere fisier backup)
- fisierele SQL pot fi compresate gzip, bzip2, zip

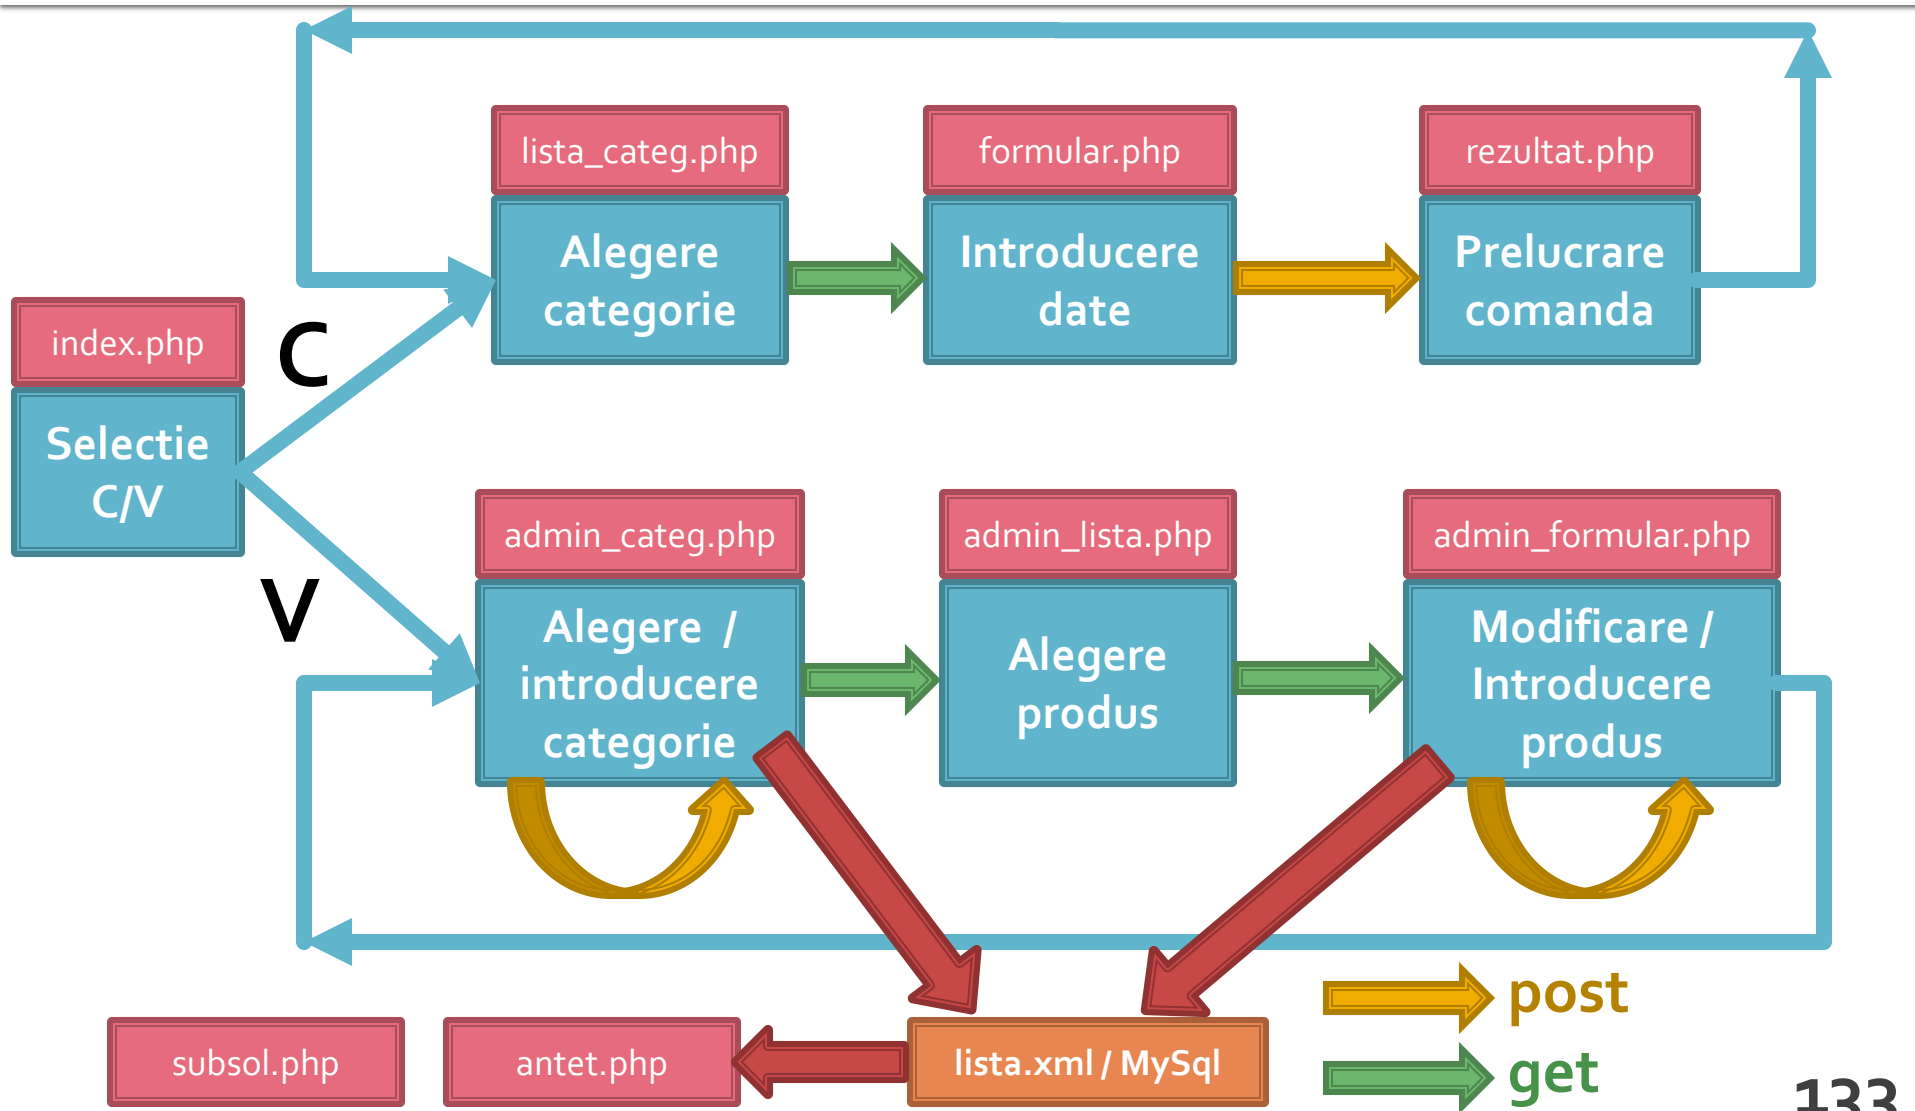

The screenshot displays the phpMyAdmin web interface. On the left sidebar, the database 'tmpaw' is selected and circled in red. The main content area shows the 'Import' page for the 'tmpaw' database. The 'Import' button in the top navigation bar is also circled in red. The 'File to Import:' section includes a text input field, a 'Browse...' button (circled in red), and a file size limit of 2048KiB. Below this, there are radio buttons for 'Browse your computer' and 'Select from the web server upload directory'. The 'Character set of the file:' dropdown is set to 'utf-8'. The 'Partial Import:' section has a checked checkbox for 'Allow the interruption of an import in case the script detects it is close to the PHP timeout limit.' and a text input field for 'Skip this number of queries (for SQL) or lines (for other formats), starting from the first one:' with the value '0'.

Laborator 6

Laborator 6+7

- Sa se continue magazinul virtual cu:
 - produsele sunt grupate pe categorii de produse

Tabel Categorii

The screenshot shows the MySQL Table Editor interface for a table named 'categorii' in the 'tmpaw' database. The table has three columns: 'id_categ' (INT(10), UNSIGNED, ZEROFILL, NULL), 'nume' (VARCHAR(45), BINARY, NULL), and 'detalii' (VARCHAR(150), BINARY, NULL). A primary index is defined on the 'id_categ' column, with index settings: Index Name: PRIMARY, Index Kind: PRIMARY, and Index Type: BTREE.

Table Name: categorii Database: tmpaw Comment: InnoDB free: 11264 kB

Columns and Indices Table Options Advanced Options

Column Name	Datatype	NOT NULL	AUTO INC	Flags	Default Value	Comment

Tabel Prognose

The screenshot shows the MySQL Table Editor window for a table named 'produse' in the 'tmpaw' database. The table has a comment 'InnoDB free: 11264 kB'. The 'Columns and Indices' tab is active, displaying a table with the following columns:

Column Name	Datatype	NOT NULL	AUTO INC	Flags	Default Value	Comment
id_produ	INT(10)	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/> UNSIGNED <input type="checkbox"/> ZEROFILL	NULL	
id_categ	INT(10)	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/> UNSIGNED <input type="checkbox"/> ZEROFILL		
nume	VARCHAR(45)	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/> BINARY		
detalii	VARCHAR(150)	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/> BINARY	NULL	
cant	INT(10)	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/> UNSIGNED <input type="checkbox"/> ZEROFILL	NULL	
pret	FLOAT	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/> UNSIGNED <input type="checkbox"/> ZEROFILL	NULL	

The 'Indices' tab is also active, showing a PRIMARY index with the following settings:

- Index Name: PRIMARY
- Index Kind: PRIMARY
- Index Type: BTREE
- Index Columns: id_produ

The 'Apply Changes', 'Discard Changes', and 'Close' buttons are visible at the bottom of the dialog.

Laborator 6 – Mod de lucru

- Se continua lucrul la aplicatie (L5)
- Se recomanda laboratorul **asincron** – S2
- Se poate folosi fisierul cu surse cpypaste.txt
(site-<http://rf-opto.etti.tuiasi.ro>)

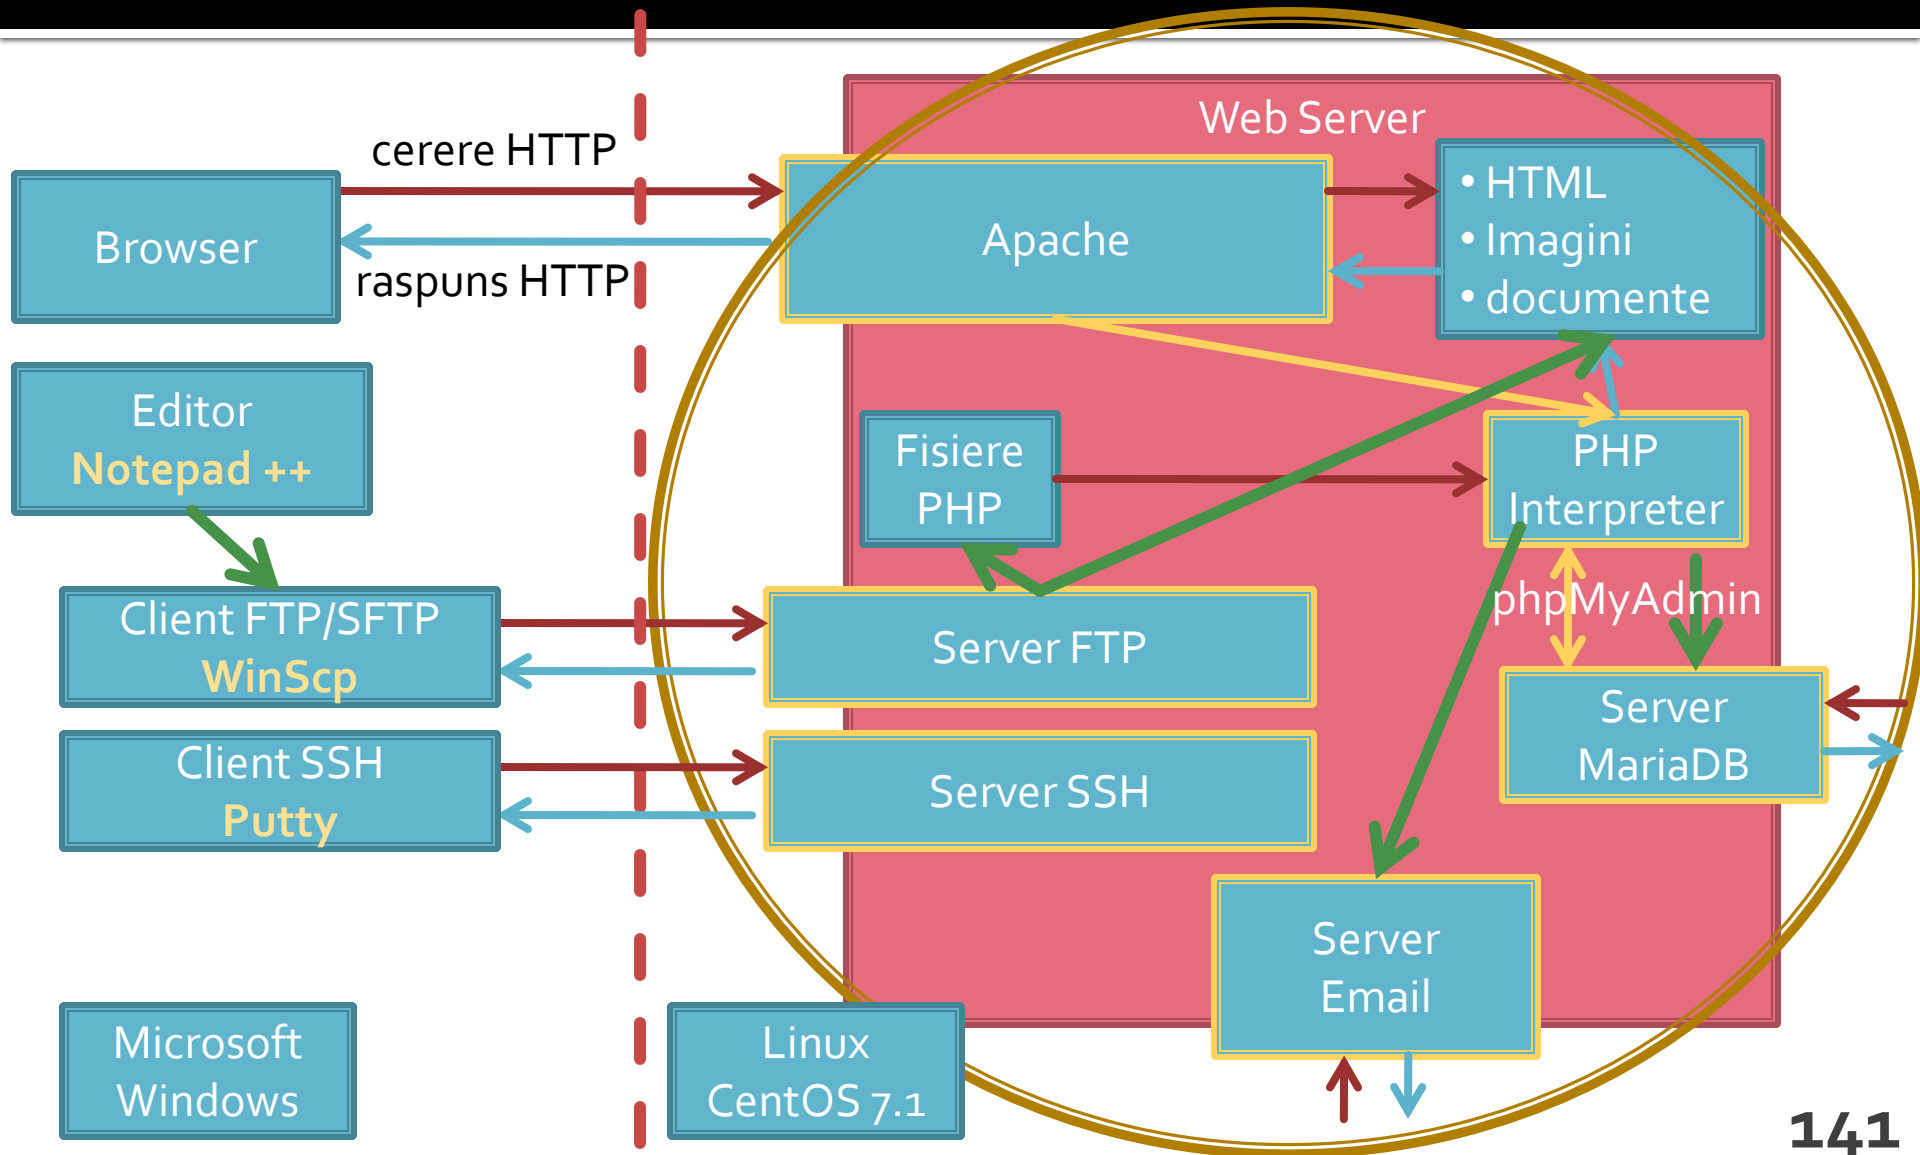

Laborator 6 – Mod de lucru

- Se ia o decizie relativ la relatia dintre produse si categorii (S63-S67)
 - One to Many
 - Many to Many
- Se creaza cele 2(3) tabele corespunzatoare
- Se populeaza cu date
- Se actualizeaza planul aplicatiei pentru a corespunde cu aplicatia proprie
 - nume de fisiere, tipuri de transfer a datelor

Laborator 6 – Mod de lucru

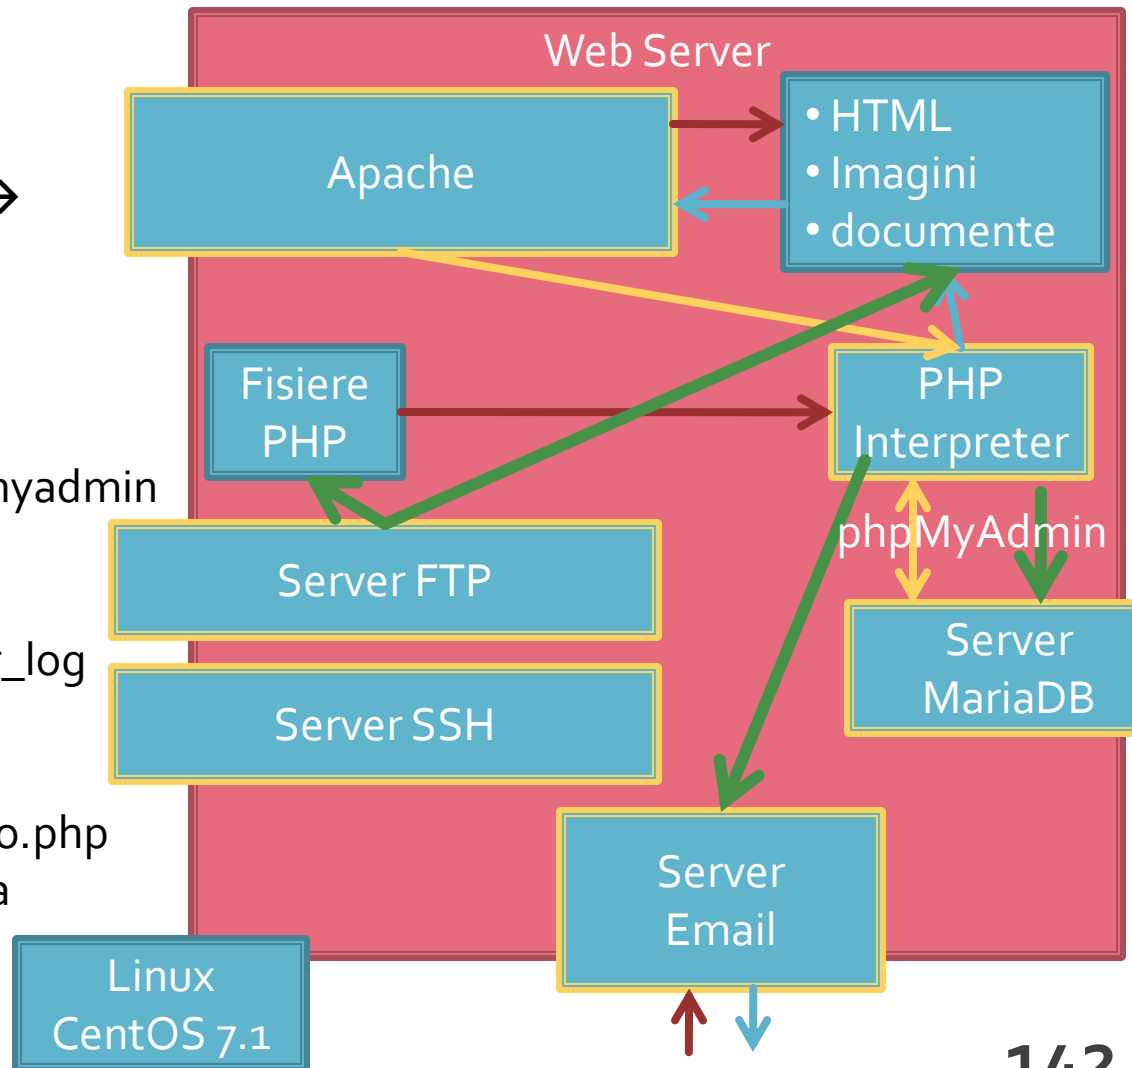

- Se creaza firul de executie paralel pentru vanzator
 - fisierele pentru cumparator reprezinta o buna cale de pornire (Save As, Copy/Paste) pentru 2 din cele 3 fisiere
- Se lucreaza cat mai mult la conversia text -> MySQL
 - activitatea se continua la laboratorul 7

Utilizare LAMP

Utilizare LAMP

1. login → root:masterrc
2. ifconfig → 192.168.30.5
3. putty.exe → 192.168.30.5 → SSH → root:masterrc (remote login)
4. [alte comenzi linux dorite]
5. FTP → Winscp → SFTP → student:masterrc@192.168.30.5
6. MySql → http://192.168.30.5/phpmyadmin → root:masterrc
7. Apache Error Log →
 - 7a. putty → nano /var/log/httpd/error_log
 - 7b. http://192.168.30.5/logfile.php (nonstandard)
8. PHP info → http://192.168.30.5/info.php
9. daca serviciul DHCP duce la oprirea Apache: `service httpd restart`

Faza de verificare/depanare

- Se recomanda utilizarea posibilitatii vizualizarii matricilor
 - In fisierul care receptioneaza datele
 - temporar pina la definitivarea codului
- utilizarea de cod "verbose" (manual) in etapele initiale de scriere a surselor PHP poate fi extinsa si la alte tipuri de date
 - singura (aproape) metoda de depanare(debug) in PHP
 - `<p>temp <?php echo "a=";echo $a; ?> </p>`

```
echo "<pre>";  
print_r($_POST);  
echo "</pre>";
```

Depanare

```
echo "<pre>";  
print_r($_POST);  
echo "</pre>";
```

```
<p>temp <?php echo  
"a=";echo $a; ?> </p>
```
