

Laborator 6

2020/2021

# Programarea aplicațiilor web

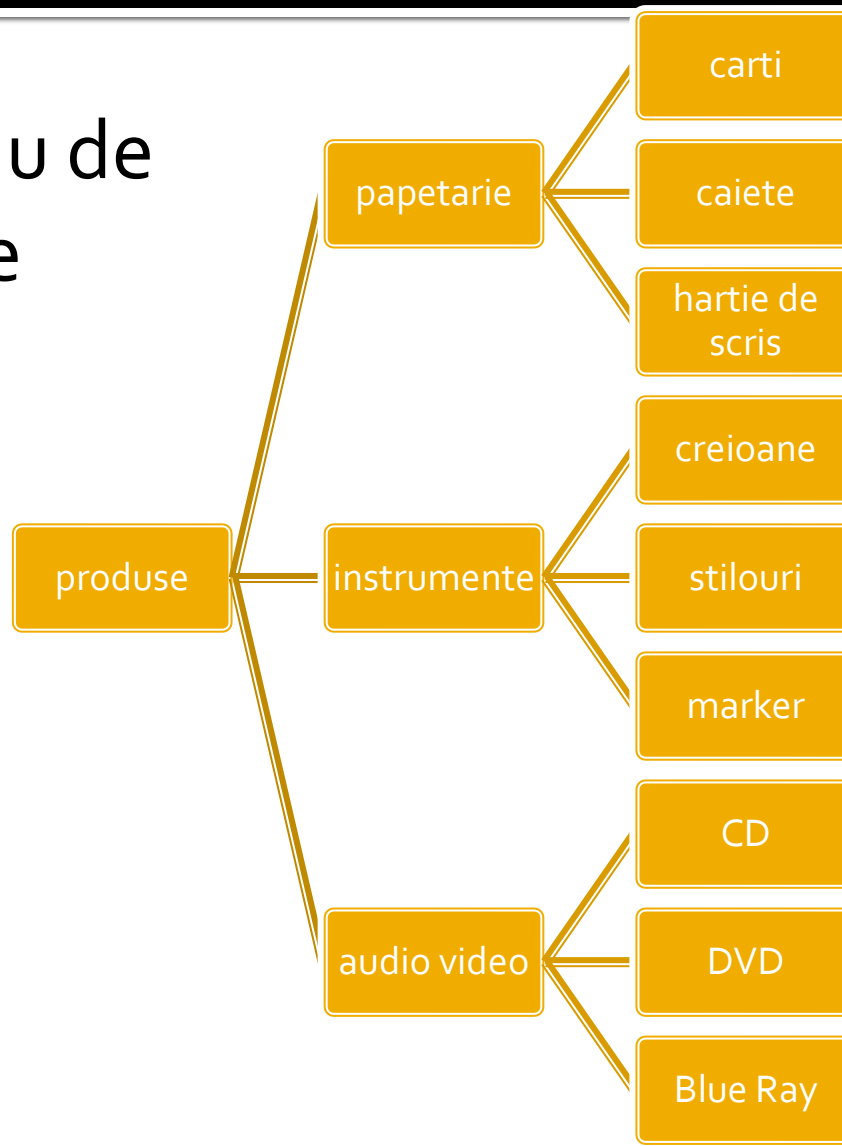

# Laborator 5

# Laborator 5

- Sa se continue magazinul virtual cu:
  - produsele sunt grupate pe **categorii** de produse
  - sa prezinte utilizatorului o lista de categorii de produse pentru a alege
  - sa prezinte utilizatorului o lista de produse si preturi in categoria aleasa
  - lista de produse si preturi se citește dintr-un **fisier**
  - se preia comanda si se calculeaza suma totala
- Optional
  - se creaza o pagina prin care vanzatorul poate **modifica** preturile si produsele
  - fisierul care contine date in format **XML**

# Laborator 5

- exemplu de grupare

# Utilizare template

- antet.php
  - citirea datelor si realizarea matricii \$produse se realizeaza aici
  - acest lucru permite sa se realizeze usor trecerea la alte tehnologii txt → XML → MySql
    - restul fisierelor pot ramane (in mare parte) nemodificate deoarece se bazeaza pe utilizarea matricii \$produse, indiferent cum e ea realizata
- subsol.php
  - se poate utiliza la realizarea interfetei pentru vanzator
  - se salveaza matricea \$produse in formatul necesar tehnologiei utilizate

# Plan aplicatie – Cumparator

- Pe masura ce aplicatia paraseste un fir liniar de executie este necesara introducerea unui plan (graf) al aplicatiei
- Cumparator
  - citirea fisierului XML (accesarea bazei de date) se realizeaza in antet.php, comun pentru toate fisierele

lista\_categ.php  
CATEGORII PRODUSE

PRODUSE, PRET,  
COMANDA

rezultat.php  
PRELUCRARE  
COMANDA

# Plan aplicatie – Vanzator

- Aparitia aplicatiei pentru vanzator
  - introduce un fir paralel de executie cu necesitatea alegerii initiale: cumparator/vanzator
  - aduce posibilitatea scrierii fisierului XML
  - diverse operatii de scriere
    - introducere categorie de produse
    - introducere produs nou intr-o categorie existenta
    - modificare produs existent
  - modificarea fisierului implica 2 actiuni:
    - colectare date
    - prelucrare

# Plan aplicatie (Proiect !!)

# Fisier unic pentru colectare SI prelucrare date

- De multe ori se prefera aceasta varianta
- Permite pastrarea unitara a tuturor operatiilor pentru indeplinirea unei actiuni
  - acces mai simplu
  - usurinta la programare
  - evitarea erorilor: File does not exist: D:/Server/...
- Acelasi fisier e folosit initial pentru a colecta date si apoi, daca se detecteaza prezenta acestora, pentru prelucrarea lor

# Fisier unic pentru colectare SI prelucrare date

- Fisierul de receptie pentru <form> va fi fisierul curent
- se recomanda utilizarea variabilei globale `$_SERVER['SCRIPT_NAME']`
  - flexibilitate la redenumirea fisierelor
- alternativ `$_SERVER['PHP_SELF']` nu este recomandata
  - probleme de securitate
- Sectiunea de colectare date se afiseaza numai in absenta datelor

```
<form action="<?php echo $_SERVER['SCRIPT_NAME'];?>" method="post">  
<p><input name="date_ok" type="submit" value="Trimite" /></p>  
</form>
```

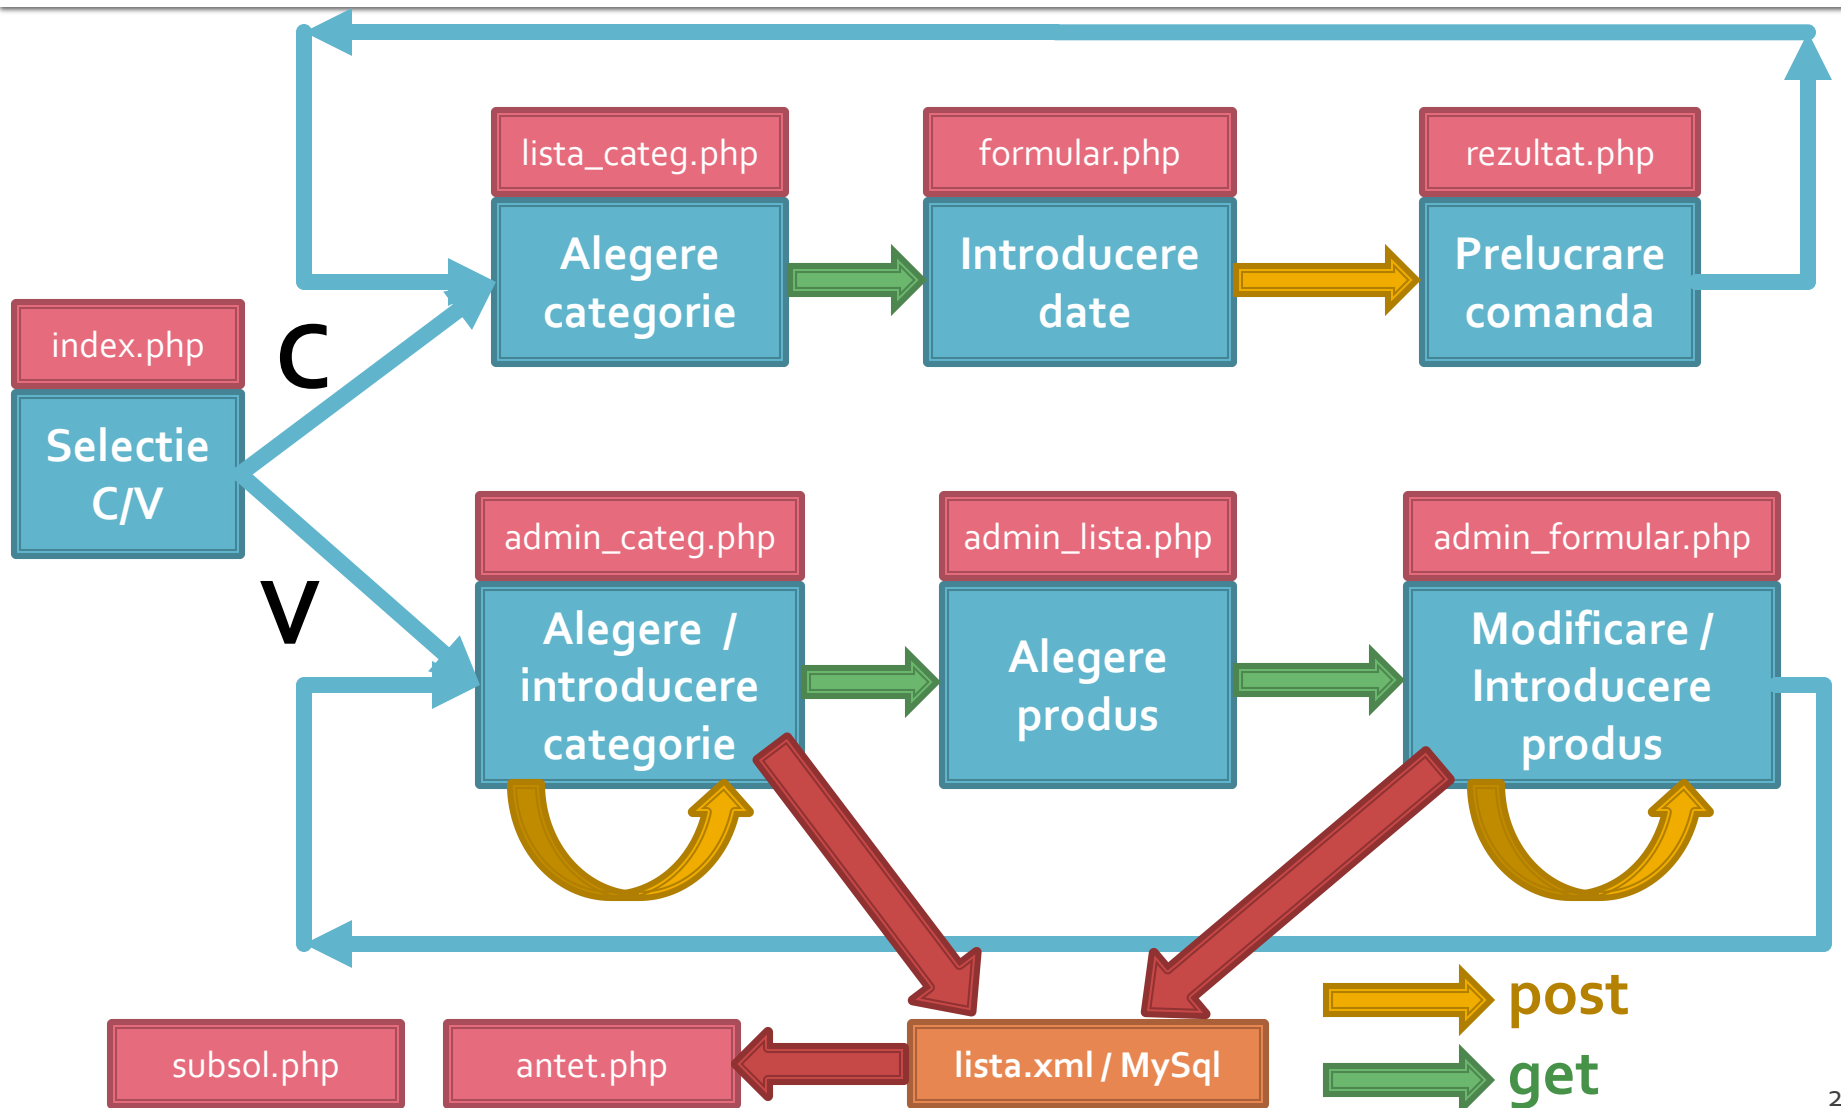

# Fisier unic pentru colectare SI prelucrare date

- Detectia existentei datelor se face prin verificarea existentei ( isset(\$variabila) ) valorilor introduse
  - eventual pentru un plus de protectie se poate verifica si continutul lor

```
if (isset($_POST["date_ok "]))
{ //date trimise
  if ($_POST["date_ok "]=="Trimite" )
  { //date trimise de fisierul curent
    //prelucrare
  }
}
else
{
  //colectare date
  <form action="<?php echo $_SERVER['SCRIPT_NAME '];?>" method="post">
  <p><input name="date_ok" type="submit" value="Trimite" /></p></form>
}
```

MySql

# Laborator 6

# Relatii in Bazele de date

- In exemplul utilizat avem doua concepte diferite din punct de vedere logic
  - produs
  - categorie de produs
- Cele doua tabele nu sunt independente
- Intre ele exista o legatura data de functionalitatea dorita pentru aplicatie: **un produs va apartine unei anumite categorii de produse**

# Relatii in Bazele de date

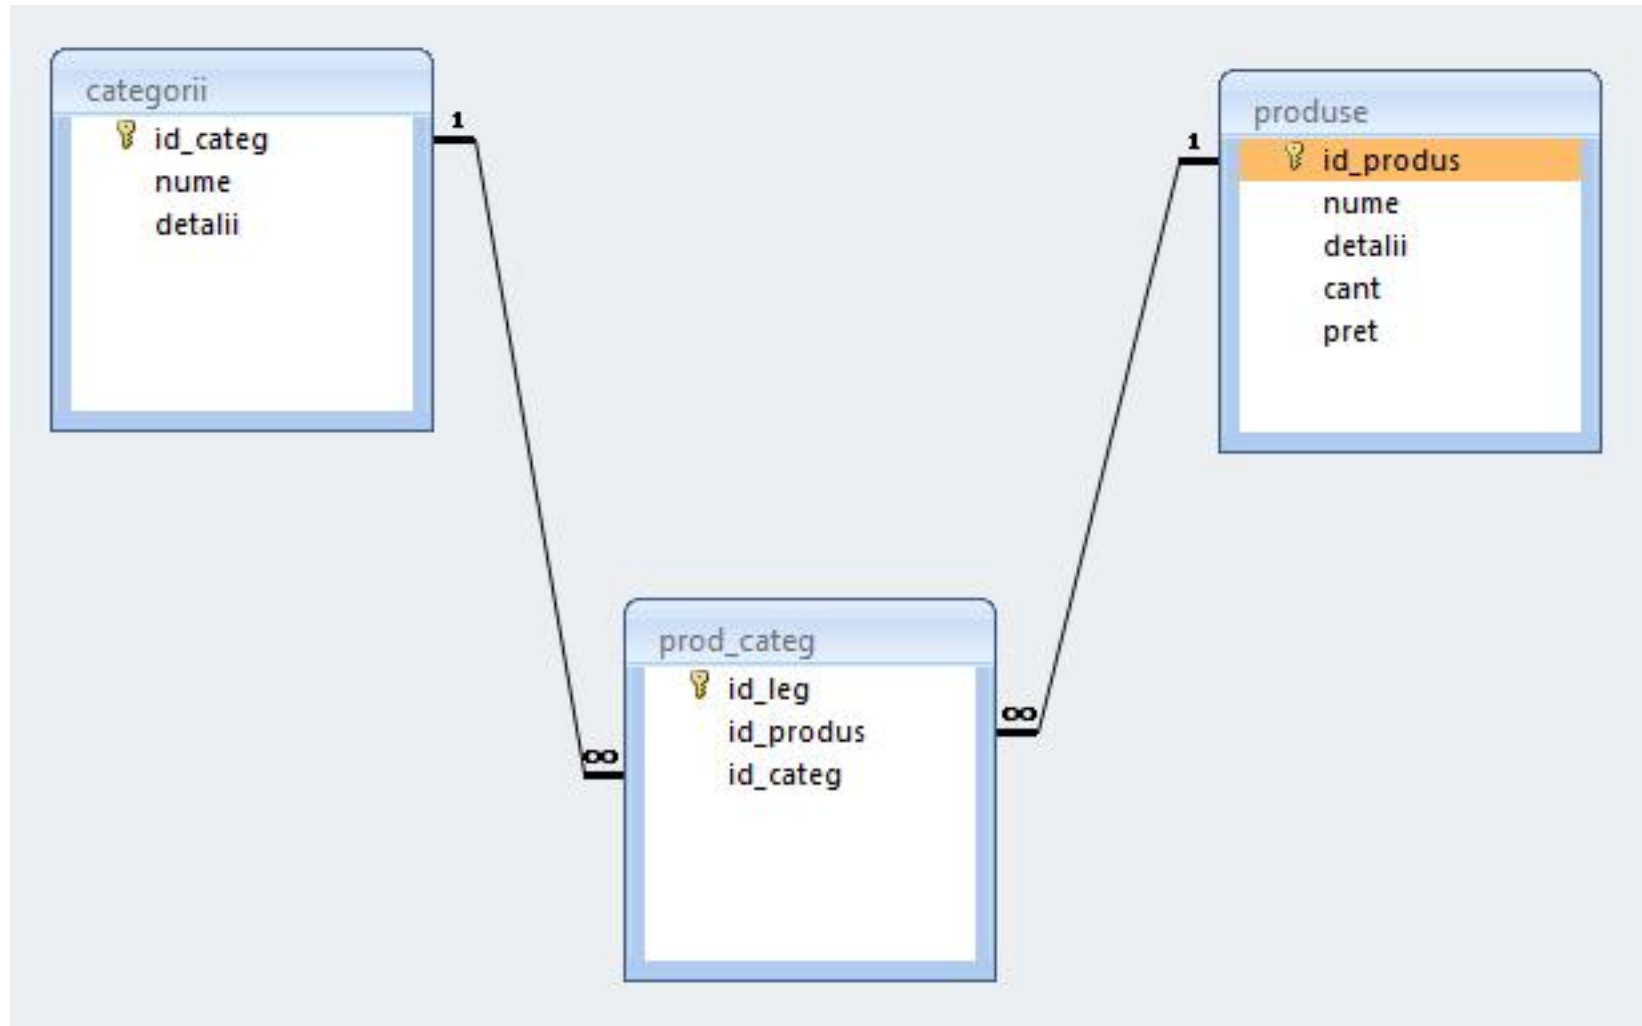

- Legaturile implementata
  - One to Many
  - in tabelul "produse" apare cheia externa (foreign key): "id\_categ"

# Relatii in Bazele de date

- Daca se doreste o situatie cand un produs poate apartine **mai multor categorii** (o carte cu CD poate fi inclusa si in "papetarie" si in "audio-video")
  - relatia devine de tipul **Many to Many**
  - e necesara introducerea unui tabel de legatura cu coloanele "id\_leg" (cheie primara), "id\_categorie" si "id\_produs" (chei externe)

# Relatii in Bazele de date

# Relatii

- Nu trebuie evitate relatiile
  - Many to Many
  - One to Many
- Prelucrarea cade in sarcina server-ului de baze de date (RDBMS)
  - JOIN – **esential** in aplicatii cu baze de date

# Metode de lucru recomandate

- La implementarea unei aplicatii noi (proiect)
  1. Identificarea structurii logice a datelor utilizate
    - "clase" de obiecte/fenomene tratate identic
    - se are in vedere scalabilitatea (posibilitatea de crestere a numarului de elemente dintr-o clasa)
  2. Realizarea structurii bazei de date
    - In general un tabel pentru fiecare clasa logica distincta **DAR...**
    - se are in vedere scalabilitatea (daca aplicatia creste sa **NU** apara cresterea numarului de clase/tabele) **SI...**
    - normalizare
  3. Identificarea tipului de date necesar pentru coloane
    - de preferat numerele intregi in orice situatie care presupune ordonare
    - dimensiunea campurilor nu mai mare decat e necesar (poate fi fortata prin atributul "size" in eticheta HTML "input")
  4. Popularea manuala a bazei de date cu date initiale
    - MySql Query Browser (sau PhpMyAdmin) / automat / imprumut
    - programarea individuala a paginilor are nevoie de prezenta unor date

# MySql – eficienta

- eficienta unei aplicatii web
  - 100% - **toate prelucrarile "mutate" in RDBMS**
  - PHP **doar** afisarea datelor
- eficienta unei aplicatii MySql
  - 25% **alegerea corecta a tipurilor de date**
  - 25% **crearea indecsilor necesari in aplicatii**
  - 25% **normalizarea corecta a bazei de date**
  - 20% **cresterea complexitatii interogarilor pentru a "muta" prelucrarile pe server-ul de baze de date**
  - 5% **scrierea corecta a interogarilor**

MySql – Server Windows 2000

# **Mini – Indrumar practic**

## **Lucru cu bazele de date**

# Realizarea bazei de date

- Se recomanda utilizarea utilitarului **MySQL Query Browser** sau un altul echivalent pentru crearea scheletului de baza de date (detalii – laborator 1)
- Se initializeaza aplicatia cu drepturi depline (“root” si parola)
  - se creaza o noua baza de date:
    - in lista “Schemata” – Right click – Create New Schema
  - se activeaza ca baza de date curenta noua “schema” – Dublu click pe numele ales

# Introducere tabele

- Introducere tabel – Click dreapta pe numele bazei de date aleasa – Create New Table
- se defineste structura tabelului
  - nume coloane
  - tip de date
  - NOT NULL – daca se accepta ca acea coloana sa ramana fara date (NULL) sau nu
  - AUTOINC – daca acea coloana va fi de tip intreg si va fi incrementata automat de server (util pentru crearea cheilor primare)
  - Default value – valoarea implicita care va fi inserata daca la introducerea unei linii noi nu se mentioneaza valoare pentru acea coloana (legat de optiunea NOT NULL)

# Tabel Categorii

# Tabel Prognose

# Introducere date initiale

- Dublu click pe tabel → In zona "SQL Query Area" se completeaza interogarea de selectie totala
  - `SELECT * FROM produse p;`
- Executia interogarii SQL
  - Meniu → Query → Execute
  - Bara de butoane 
- Lista rezultata
  - initial vida
  - poate fi editata – butoanele "Edit", "Apply Changes", "Discard Changes" din partea de jos a listei

# Introdúcere date initiale

MySQL Query Browser - Connection: root@server / tmpaw

File Edit View Query Script Tools Window Help

Transaction Explain Compare

# Backup, Restore, drepturi de acces

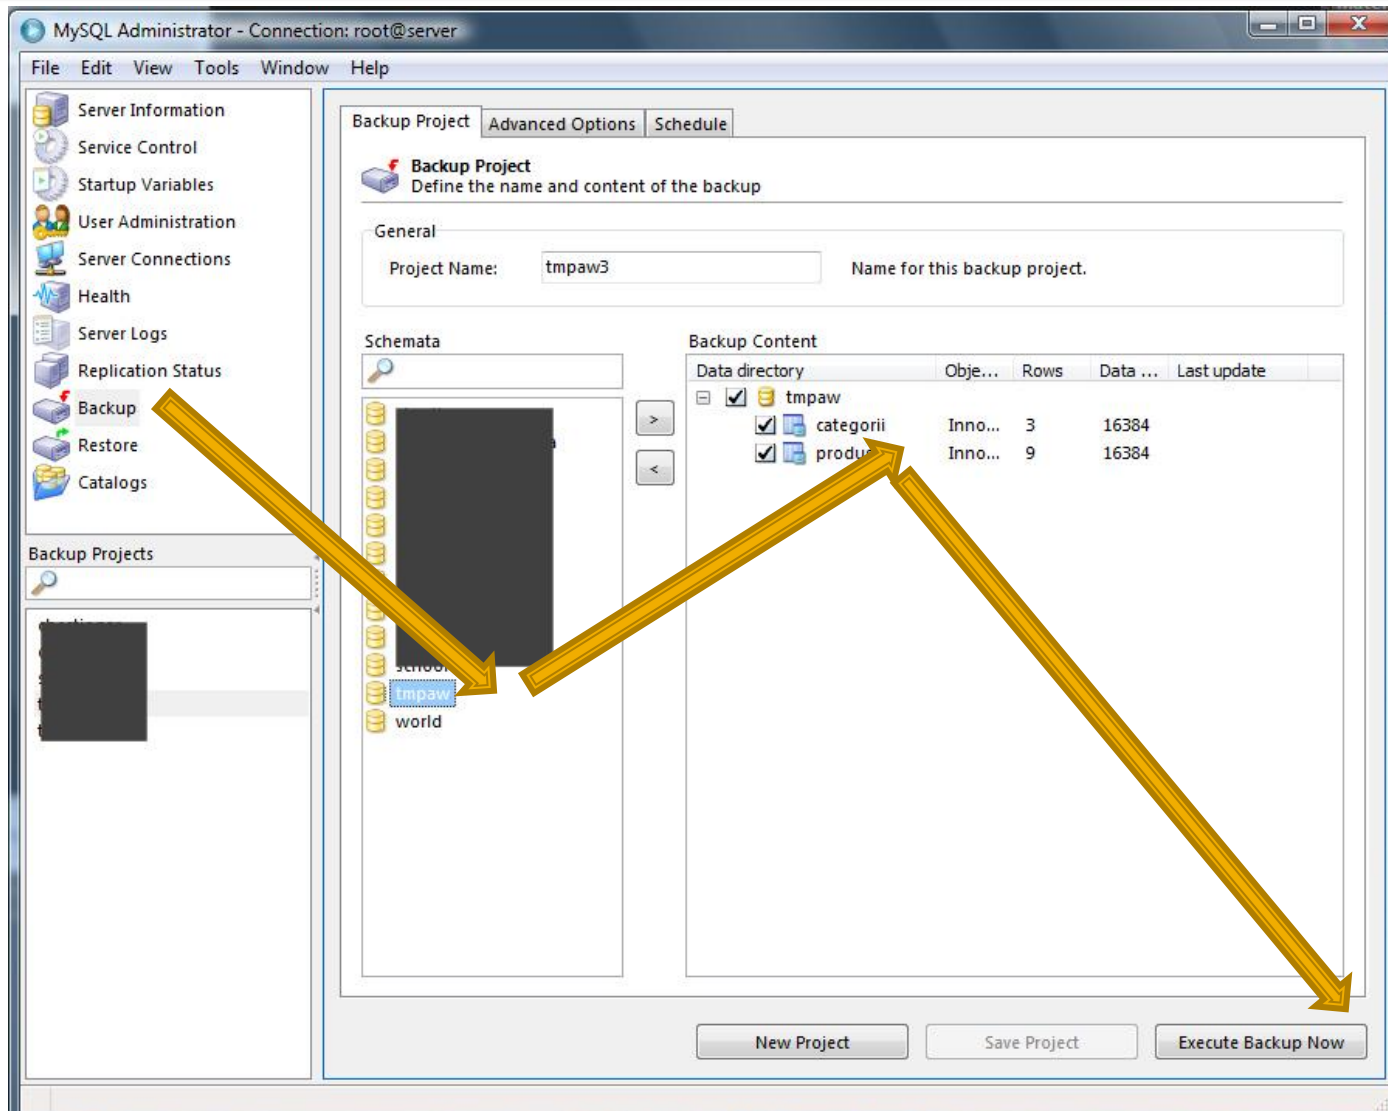

- Se recomanda utilizarea utilitarului **MySQL Administrator** sau un altul echivalent (detalii – laborator 1)
- Se initializeaza aplicatia cu drepturi depline ("root" si parola)
- Se creaza un utilizator limitat (detalii – laborator 1)
- Se aloca drepturile "SELECT" + "INSERT" + "UPDATE" asupra bazei de date create (sau mai multe daca aplicatia o cere)

# Drepturi de acces

# Backup

# Restaurarea bazei de date

- Din **MySql Administrator**
  - Sectiunea Restore → "Open Backup File"
- Din **MySql Query Browser**
  - Meniu → File → Open Script
  - Executie script SQL
    - Meniu → Script → Execute
    - Bara de butoane 
- Scriptul SQL rezultat contine comenzile/interogariile SQL necesare pentru crearea bazei de date si popularea ei cu date

# Script SQL Backup - utilitate

- Poate fi folosit ca un model extrem de bun pentru comenzile necesare pentru crearea programatica (din PHP de exemplu) a bazei de date

```
CREATE DATABASE IF NOT EXISTS tmpaw;  
USE tmpaw;  
  
DROP TABLE IF EXISTS `categorii`;  
CREATE TABLE `categorii` (  
  `id_categ` int(10) unsigned NOT NULL auto_increment,  
  `nume` varchar(45) NOT NULL,  
  `detalii` varchar(150) default NULL,  
  PRIMARY KEY (`id_categ`)  
) ENGINE=InnoDB DEFAULT CHARSET=latin1;  
  
INSERT INTO `categorii` (`id_categ`,`nume`,`detalii`) VALUES  
(1,'papetarie',NULL),  
(2,'instrumente',NULL),  
(3,'audio-video',NULL);
```

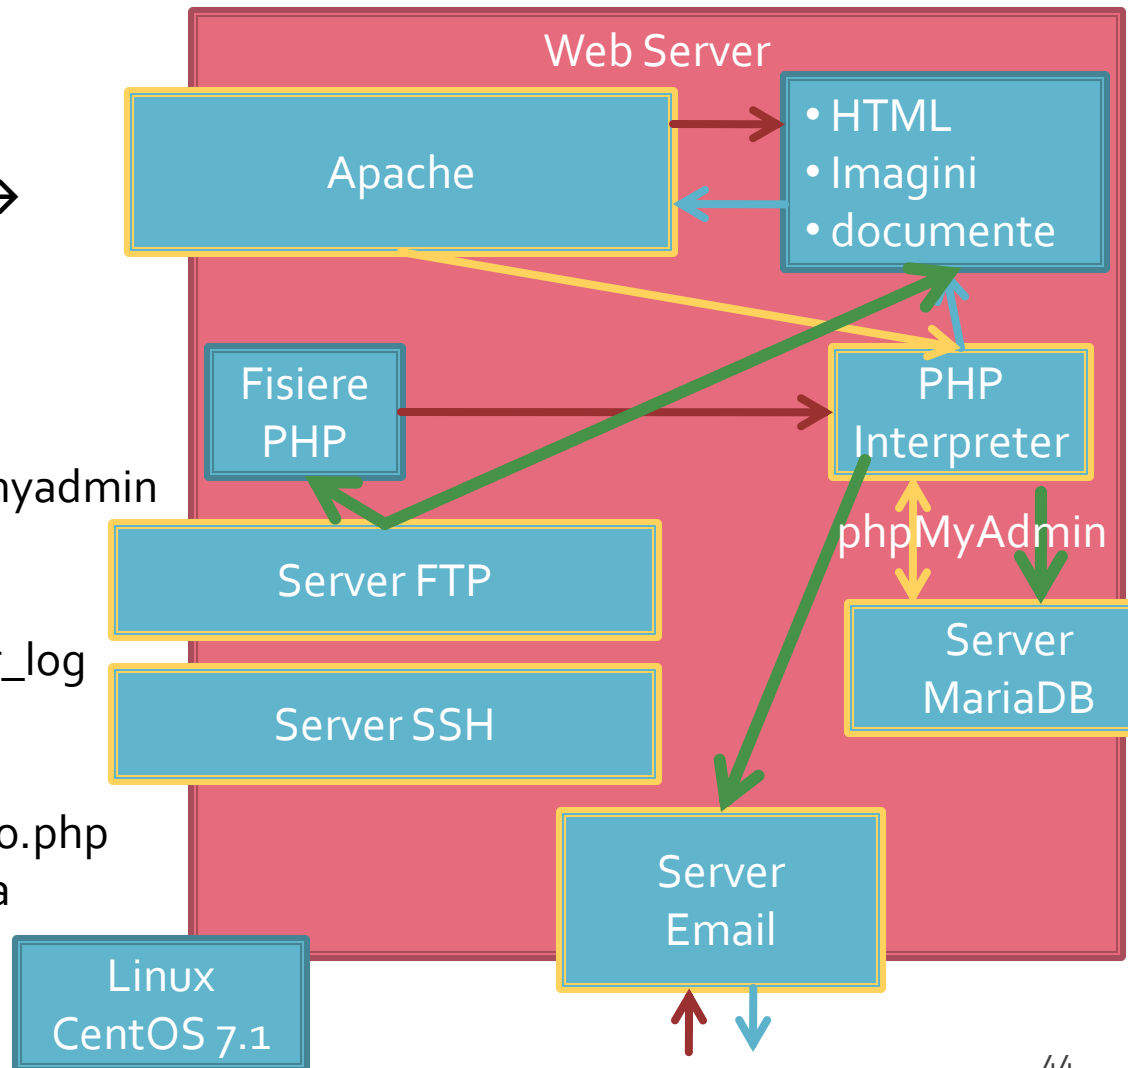

MySQL – Server Centos 7.1

# Mini – Indrumar practic

## Lucru cu bazele de date

# Utilizare LAMP

1. login → root:masterc
2. ifconfig → 192.168.30.5
3. putty.exe → 192.168.30.5 → SSH → root:masterc (remote login)
4. [alte comenzi linux dorite]
5. FTP → Winscp → SFTP → student:masterc@192.168.30.5
6. MySql → http://192.168.30.5/phpmyadmin → root:masterc
7. Apache Error Log →
  - 7a. putty → nano /var/log/httpd/error\_log
  - 7b. http://192.168.30.5/logfile.php (nonstandard)

# PhpMyAdmin

The screenshot displays the PhpMyAdmin web interface in a browser window. The address bar shows the URL `http://192.168.0.50/phpmyadmin/#PMAURL-0:index.php`. The interface includes a top navigation bar with tabs for Databases, SQL, Status, Users, Export, Import, Settings, Replication, Variables, Charsets, and Engines. The left sidebar shows a tree view of databases: information\_schema, mysql, performance\_schema, and world. The main content area is divided into several panels:

- General Settings**: Includes a "Change password" link and a "Server connection collation" dropdown set to "utf8mb4\_unicode\_ci".
- Appearance Settings**: Includes a "Language" dropdown set to "English", a "Theme" dropdown set to "pmahomme", and a "Font size" dropdown set to "82%". A "More settings" link is also present.
- Database server**: Lists server details:
  - Server: Localhost via UNIX socket
  - Server type: MariaDB
  - Server version: 5.5.44-MariaDB - MariaDB Server
  - Protocol version: 10
  - User: root@localhost
  - Server charset: UTF-8 Unicode (utf8)
- Web server**: Lists web server details:
  - Apache/2.4.6 (CentOS) OpenSSL/1.0.1e-fips mod\_fcgid/2.3.9
  - PHP/5.4.16 mod\_python/3.5.0- Python/2.7.5
  - Database client version: libmysql - 5.5.44-MariaDB
  - PHP extension: mysqli
  - PHP version: 5.4.16
- phpMyAdmin**: Lists version information and links:
  - Version information: 4.4.15.1
  - Documentation
  - Wiki
  - Official Homepage
  - Contribute
  - Get support
  - List of changes

# Creare Baza de Date

- Databases → "nume" → Create

The screenshot shows the phpMyAdmin web interface. The 'Databases' tab is selected and circled in red. Below it, the 'Create database' section is visible, with the database name 'tmpaw' entered in the text field, 'utf8\_general\_ci' selected in the collation dropdown (also circled in red), and the 'Create' button circled in red. A list of existing databases is shown below, including 'information\_schema', 'mysql', 'performance\_schema', and 'world'. At the bottom, there are checkboxes for 'Check All' and 'Enable Statistics'.

phpMyAdmin

# Creare tabelle in baza de date

- Baza de date (in lista) → Structure → div Create Table → nume/coloane → Go

# Introducere coloane, tabel categorii

- (eventual ) Adaugare coloane / Stabilire nume
- Name / Type / Length / Default

The screenshot shows the phpMyAdmin interface for a table named 'categorii' in the 'tmpaw' database. The table structure is displayed with the following columns:

Name	Type	Length/Values	Default	Collation
id_categ	INT		None	
nume	VARCHAR	45	None	
detalii	VARCHAR	150	None	

The interface also includes a 'Table comments:' field and a 'Collation:' dropdown menu. The 'Storage Engine' is set to 'InnoDB'.

# Introducere coloane

- (eventual) NOT NULL / Index / Auto Increment
  - in functie de “necesitatile” coloanei respective

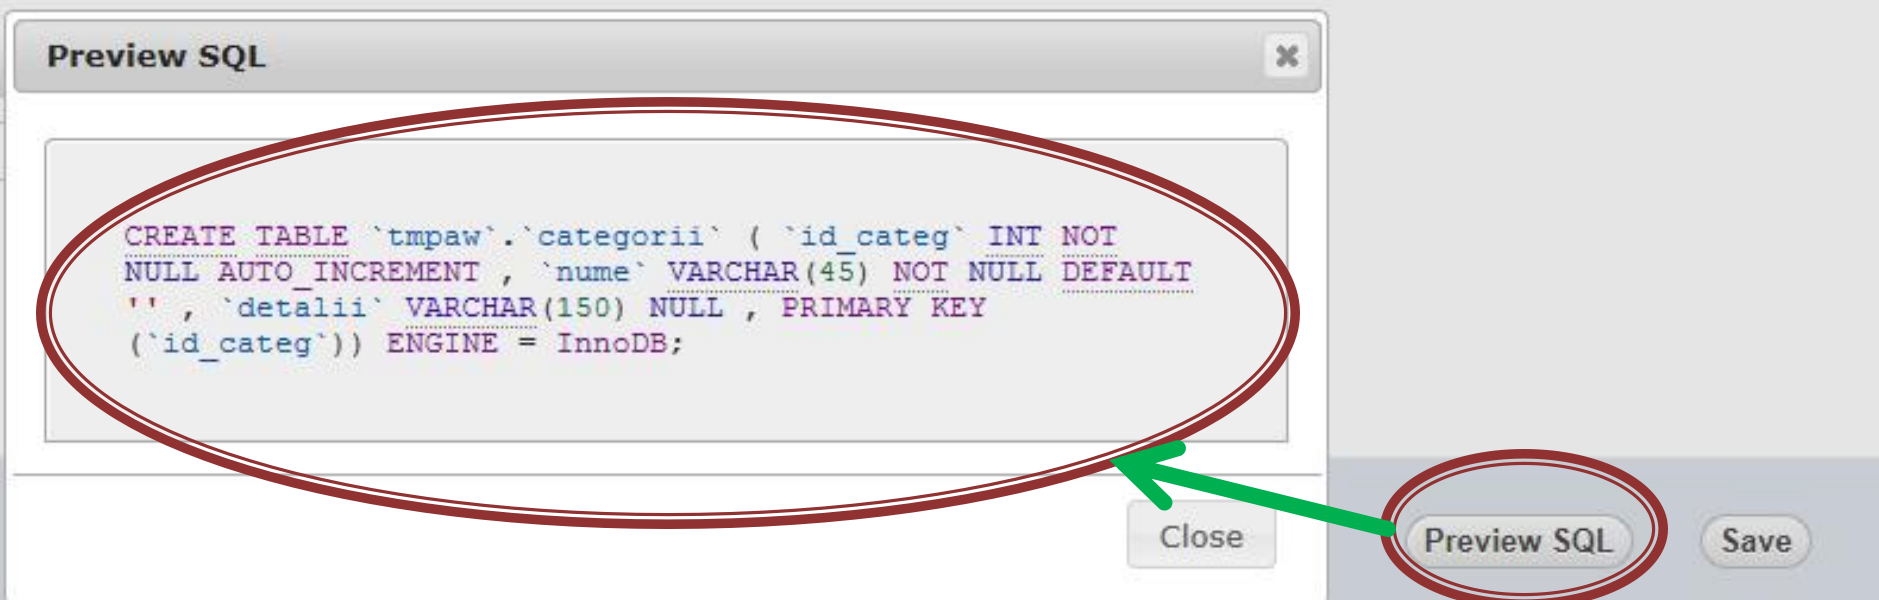

Table name:  Add  column(s)

Structure

Name	Type	Length/Values	Default	Collation	Attributes	Null	Index	A_I	Comments
id_categ	INT		None			<input type="checkbox"/>	PRIMARY	<input checked="" type="checkbox"/>	
nume	VARCHAR	45	As defined:			<input type="checkbox"/>	---	<input type="checkbox"/>	
detalii	VARCHAR	150	None			<input checked="" type="checkbox"/>	---	<input type="checkbox"/>	

# Preview SQL

- in aproape toate etapele in PhpMyAdmin
  - exemplu de cod SQL/schelet utilizabil (copy/paste) in aplicatia PHP
  - modificari de finete absente din interfata
    - copy → Sectiune "SQL" in interfata → paste → modificare

# Introducere coloane, tabel produse

- New → Nume → Add Columns → ...

The screenshot shows the phpMyAdmin interface. On the left, the 'Database: tmpaw' is selected in the sidebar. The main area displays the 'Add Columns' form for the table 'produse'. The 'Table name' field is 'produse', and the 'Add' button is set to '1' column(s). The 'Go' button is visible. Below the form, the 'Structure' tab is active, showing a table with columns: id\_produs (INT, PRIMARY), id\_categ (INT), nume (VARCHAR, 45), detalii (VARCHAR, 150), cant (INT), and pret (FLOAT). The 'Type' dropdown for 'pret' is set to 'FLOAT'.

Name	Type	Length/Values	Default	Collation	Attributes	Null	Index	A_I
id_produs	INT		None			<input type="checkbox"/>	PRIMARY	<input checked="" type="checkbox"/>
id_categ	INT		None			<input type="checkbox"/>	---	<input type="checkbox"/>
nume	VARCHAR	45	As defined:			<input type="checkbox"/>	---	<input type="checkbox"/>
detalii	VARCHAR	150	None			<input checked="" type="checkbox"/>	---	<input type="checkbox"/>
cant	INT		None			<input checked="" type="checkbox"/>	---	<input type="checkbox"/>
pret	FLOAT		None			<input checked="" type="checkbox"/>	---	<input type="checkbox"/>

# Introducere date initiale (interfata)

- Tabel → Insert → Completare → Go

The screenshot shows the phpMyAdmin interface for a database named 'tmpaw'. The left sidebar shows the database structure, with 'categorii' selected under 'tmpaw'. The main area displays the 'Insert' form for the 'categorii' table. The form has columns: 'id\_categ' (int(11)), 'nume' (varchar(45)), and 'detalii' (varchar(150)). The 'nume' field contains the value 'papetarie'. The 'Go' button is at the bottom right. Below the form, there are options to 'insert as new row' and 'Go back to previous page'. At the bottom, it says 'Continue insertion with 1 row'.

Column	Type	Function	Null	Value
id_categ	int(11)			
nume	varchar(45)			papetarie
detalii	varchar(150)		<input checked="" type="checkbox"/>	

Insert as new row and then Go back to previous page

Continue insertion with 1 row

# Vizualizare date existente

- Tabel → Browse → salt la pagina (numar de linii pe pagina)

The screenshot shows the phpMyAdmin interface. The left sidebar shows the database structure with 'tmpaw' selected. The 'categorii' table is highlighted. The main area shows the 'Browse' tab for the 'categorii' table. The table structure is displayed with columns: id\_categ, nume, and detalii. The data rows are:

id_categ	nume	detalii
1	papetarie	NULL
2	instrumente	NULL
3	audio-video	NULL

The 'id\_categ' column is circled in red. The 'Browse' tab is also circled in red. The 'Showing rows 1-2 (3 total, Query took 0.0003 seconds.)' message is visible at the top of the table view.

# Introducere date initiale (SQL)

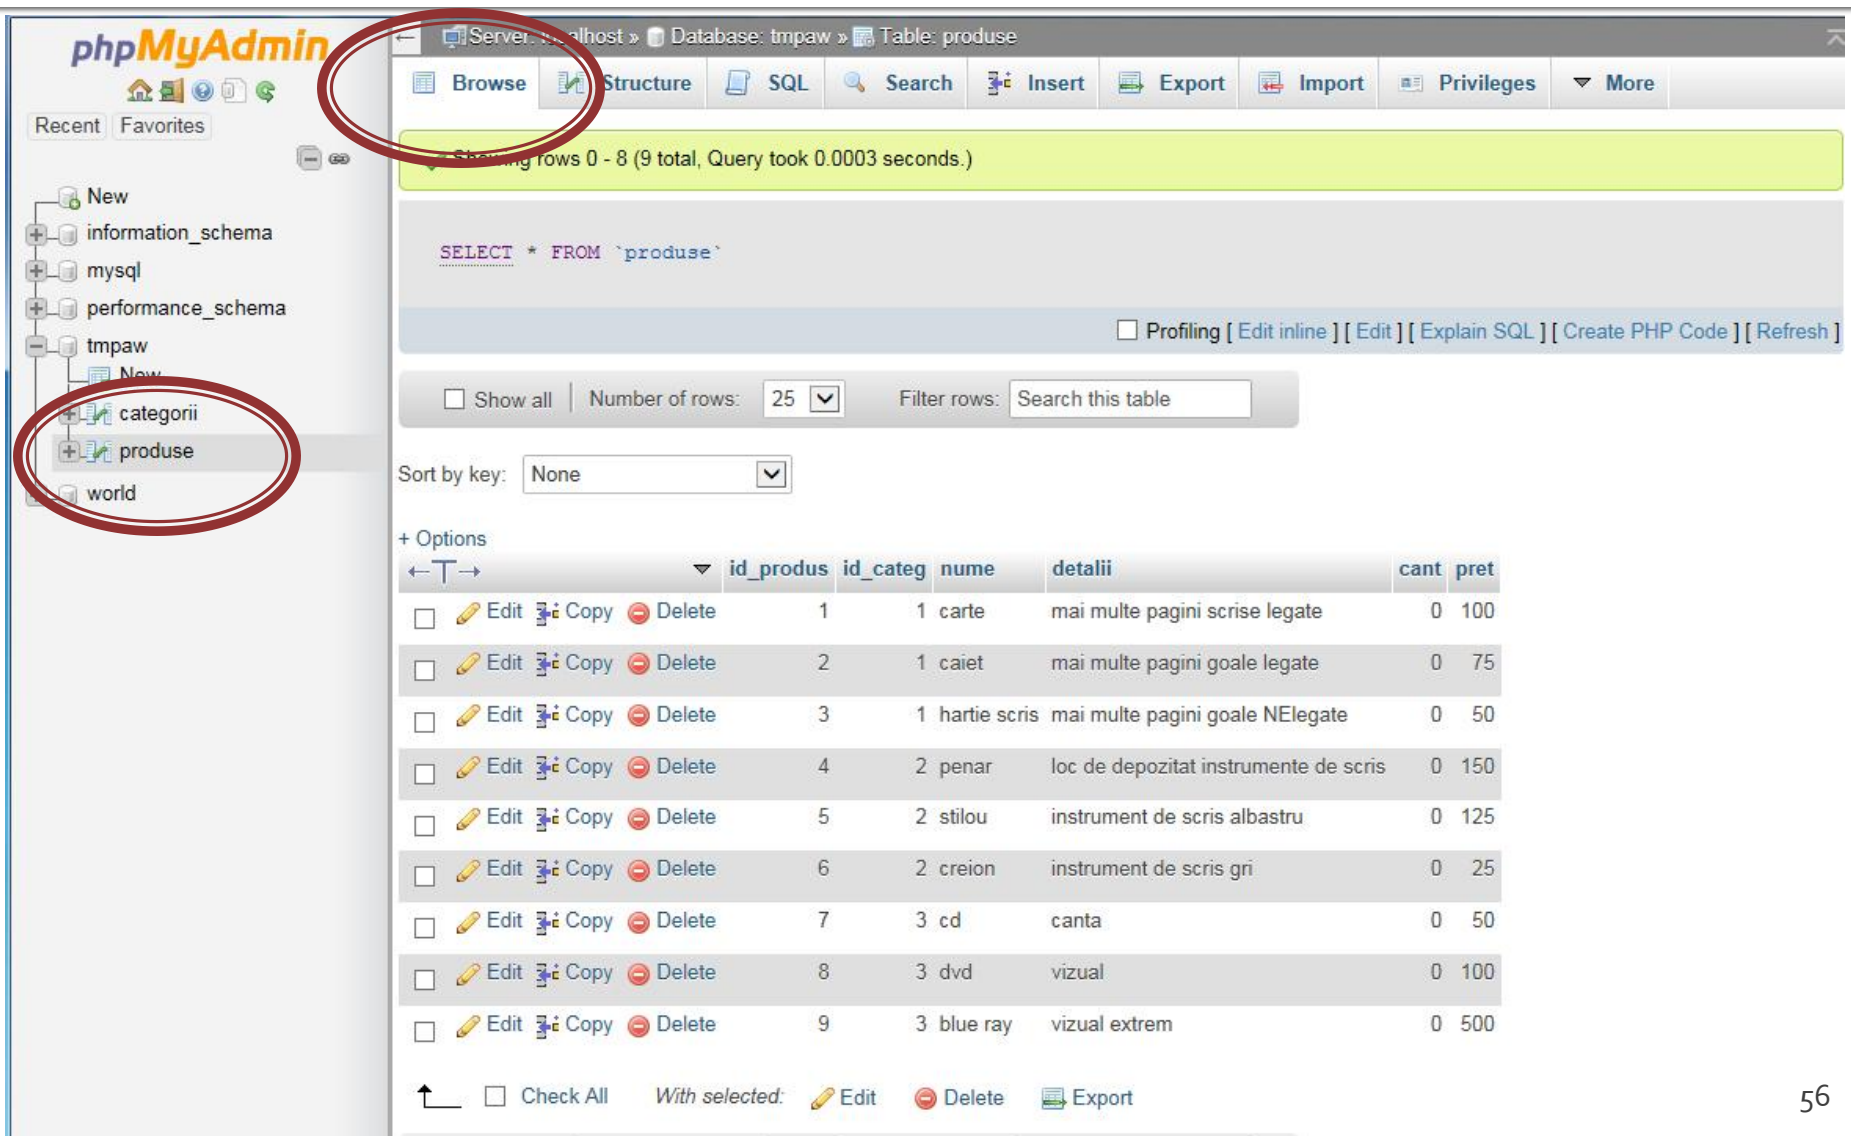

- Tabel → SQL → completare → Go

The screenshot shows the phpMyAdmin interface with the following elements:

- Left sidebar:** A tree view of databases. The 'tmpaw' database is selected, and the 'produse' table is highlighted. Red circles highlight the 'produse' table and the 'New' button above it.
- Top navigation:** Tabs for 'Browse', 'Structure', 'SQL', 'Search', 'Insert', 'Export', 'Import', 'Privileges', 'Operations', and 'Triggers'. The 'SQL' tab is active and highlighted with a red circle.
- SQL Query Area:** A text box containing an SQL INSERT statement. A red circle highlights the entire query text.

```
1 INSERT INTO `produse` (`id_produș`, `id_categ`, `nume`, `detalii`, `cant`, `pret`)
2 VALUES
3 (1,1,'carte','mai multe pagini scrise legate',0,100),
4 (2,1,'caiet','mai multe pagini goale legate',0,75),

Add user

# Adaugare utilizator

- Nu e recomandabil/**posibil** sa se utilizeze user-ul MySql "root" pentru aplicatii

The screenshot shows the phpMyAdmin interface for adding a new user. The left sidebar displays a tree view of databases and tables, including 'information\_schema', 'mysql', 'performance\_schema', 'tmpaw', 'categorii', 'produse', and 'world'. The main panel is titled 'Add user' and contains a 'Login Information' section. This section has four rows of input fields: 'User name:' with a text field containing 'web\_user'; 'Host:' with a dropdown menu showing 'Any host'; 'Password:' with a text field containing masked characters; and 'Re-type:' with another masked text field. A 'Generate password:' button is located at the bottom. Four red circles are drawn around the 'web\_user' text field, the 'Any host' dropdown, and both the password and re-type password text fields, highlighting the fields where user credentials are entered.

# Drepturi de acces

- Server → Users → Edit Privileges

The screenshot shows the phpMyAdmin interface. The top navigation bar includes links for Databases, SQL, Status, Users, Export, Import, and Settings. The 'Users' link is circled in red. Below the navigation bar, the 'Users overview' table is displayed. The table has columns: User name, Host, Password, Global privileges, Grant, and Action. The 'Action' column contains links for 'Edit Privileges' and 'Export'. The 'Edit Privileges' link for the 'web\_user' row is circled in red. The left sidebar shows the database structure with a tree view.

	User name	Host	Password	Global privileges	Grant	Action

# Index

- Adaugare index e esentiala pentru viteza
  - exemplu, produse grupate pe categorii, selectia produselor dintr-o categorie se face cu :
    - `SELECT * FROM `produse` WHERE `id_categ` = 1`
- Tabel → Structure → Index / Selectare + Index

The screenshot shows the phpMyAdmin interface. On the left, the database structure tree is visible, with 'produse' selected under the 'categorieii' database. The main panel shows the 'Table structure' view for the 'produse' table. The table has the following columns:

#	Name	Type	Collation	Attributes	Null	Default	Extra	Action
1	id_produs	int(11)			No	None	AUTO_INCREMENT	Change Drop Primary Unique Index Spatial Fulltext Distinct values
2	id_categ	int(11)			No	None		Change Drop Primary Unique Index Spatial Fulltext Distinct values
3	nume	varchar(45)	utf8_general_ci		No			Change Drop Primary Unique Index Spatial Fulltext Distinct values
4	detalii	varchar(150)	utf8_general_ci		Yes	NULL		Change Drop Primary Unique Index Spatial Fulltext Distinct values
5	cant	int(11)			Yes	NULL		Change Drop Primary Unique Index Spatial Fulltext Distinct values
6	pret	float			Yes	NULL		Change Drop Primary Unique Index Spatial Fulltext Distinct values

The 'Index' tab is selected, showing the following index:

Index name	Index type	Index columns
PRIMARY	PRIMARY	id_produs

The 'Index' tab is also selected in the bottom right corner of the interface.

# Verificare/Stergere index

- Apasare +Indexes, se deschide lista de indecsi
- Apasare -Indexes, se inchide lista de indecsi

- Indexes

Indexes ?

Action	Keyname	Type	Unique	Packed	Column	Cardinality	Collation	Null	Comment
 Edit  Drop PRIMARY		BTREE	Yes	No	id_produ	9	A	No	
 Edit  Drop id_categ		BTREE	No	No	id_categ	9	A	No	

Create an index on  columns

# Backup, Restore

- Ca si in cazul Windows 2000 facilitatea de Backup realizeaza un script SQL care contine structura si datele exprimate sub forma de interogari SQL
- O deosebire intre PhpMyAdmin si aplicatiile specifice MySql (aceleasi de pe Windows 2000 sau MySql Workbench) este absenta liniilor de creare a bazei de date
  - CREATE DATABASE IF NOT EXISTS tmpaw;
  - USE tmpaw;
- La utilizarea PhpMyAdmin trebuie sa se creeze manual inaintea restaurarii baza de date

# Backup

- Nume (tabel sau baza de date) → Export

The screenshot displays the phpMyAdmin web interface. On the left sidebar, the database 'tmpaw' is selected and circled in red. The main panel shows the 'Export' tab, also circled in red. The title of the page is 'Exporting tables from "tmpaw" database'. Under the 'Export Method:' section, the 'Quick' option is selected. Under the 'Output:' section, the 'Save on server' checkbox is checked. Under the 'Format:' section, 'SQL' is selected in the dropdown menu. A 'Go' button is at the bottom.

Server: localhost » Database: tmpaw

Structure SQL Search Query **Export** Import Operations

### Exporting tables from "tmpaw" database

**Export Method:**

- ☒ Quick - display only the minimal options
- ☐ Custom - display all possible options

**Output:**

- ☒ Save on server in the directory `/var/lib/phpMyAdmin/save/`
- ☐ Overwrite existing file(s)

**Format:**

SQL

Go

# Restore

- Se creaza in avans baza de date
- Nume → Import → Browse (alegere fisier backup)
- fisierele SQL pot fi compresate gzip, bzip2, zip

The screenshot shows the phpMyAdmin interface. On the left sidebar, the database 'tmpaw' is selected and circled in red. The main panel shows the 'Import' tab, also circled in red. The title is 'Importing into the database "tmpaw"'. Under 'File to Import:', there is a text area for the file name and a 'Browse...' button, both circled in red. Below this, there are radio buttons for 'Browse your computer' and 'Select from the web server upload directory'. The 'Character set of the file:' is set to 'utf-8'. Under 'Partial Import:', there is a checked checkbox for 'Allow the interruption of an import...' and a text input for 'Skip this number of queries...' set to '0'.

phpMyAdmin

Server: localhost » Database: tmpaw

Structure SQL Search Query Export Import Operations Privileges Routines

### Importing into the database "tmpaw"

**File to Import:**

File may be compressed (gzip, bzip2, zip) or uncompressed.  
A compressed file's name must end in `.[format].[compression]`. Example: `file.sql.gz`

☐ Browse your computer:  **Browse...** (Max: 2048KiB)

You may also drag and drop a file on any page.

☐ Select from the web server upload directory `/var/lib/phpMyAdmin/upload/`: There are no files to upload!

Character set of the file:

**Partial Import:**

☒ Allow the interruption of an import in case the script detects it is close to the PHP timeout limit. (This might be a good way to import large file)

Skip this number of queries (for SQL) or lines (for other formats), starting from the first one:

# Acces la server-ul MySql din PHP

# Acces la server-ul MySQL din PHP

- Bibliotecile corespunzatoare trebuie activate in php.ini – vezi laboratorul 1.
  - mysql
  - mysqli (improved accesul la functionalitati ulterioare MySQL 4.1)
- O baza de date existenta poate fi accesata daca exista un utilizator cunoscut in PHP cu drepturi de acces corespunzatoare – vezi laboratorul 1.
- O baza de date poate fi creata si din PHP dar nu e metoda recomandata daca nu e necesara
  - cod dificil de implementat pentru o singura utilizare
  - necesita existenta unui utilizatori cu drepturi mai mari pentru crearea bazei de date si alocarea de drepturi unui utilizator restrans

# Funcții PHP de acces MySQL

## ■ **mysql\_query**

- trimiterea unei interogări SQL spre server
- resource **mysql\_query** ( string query [, resource link\_idenfier] )
- rezultatul
  - SELECT, SHOW, DESCRIBE sau EXPLAIN – resursa (tabel)
  - UPDATE, DELETE, DROP, etc – true/false

## ■ **mysql\_fetch\_assoc**

- returnează o **matrice asociativă** corespunzătoare liniei de la indexul intern (indexsi de tip sir corespunzatori denumirii coloanelor – field – din tabelul de date) și incrementează indexul intern sau **false** dacă nu mai sunt linii
- array **mysql\_fetch\_assoc** ( resource result )

# Resurse MySQL

- Resursele reprezinta o combinatie intre
  - date structurate (valori + structura) rezultate in urma unor interogari SQL
  - functii de acces la aceste date/structuri
- Analogie cu POO
  - o "clasa speciala" creata in urma interogarii cu functii predefinite de acces la datele respective

# Resurse MySQL

## Structura

Index intern	Col 1 (tip date)	Col 2 (tip date)	....
1			
2			
...			

## Date

Index intern	Col 1	Col 2	....
1	Val 11	Val 12	...
2	Val 21	Val 22	...
...	...	...	...

Functii de acces la structura

Functii de acces la date

~~Acces direct~~

# Resurse MySQL

- Functiile de acces la structura sunt rareori utilizate
  - majoritatea aplicatiilor sunt concepute pe structura fixa, si cunosc structura datelor primite
  - exceptie: aplicatii generale, ex.: PhpMyAdmin
- Majoritatea functiilor de acces la date sunt caracterizate de acces secvential
  - se citesc in intregime valorile stocate pe o linie
  - simultan se avanseaza indexul intern pe urmatoarea pozitie, pregatindu-se urmatoarea citire

# Resurse MySQL

- Functiile sunt optimizate pentru utilizarea lor intr-o structura de control **do {} while()**, sau **while() {}** de control
  - returneaza FALSE cand "s-a ajuns la capat"
- tipic se realizeaza o citire (mysql\_fetch\_assoc) urmata de o bucla **do {} while()**
  - pentru a se putea introduce cod de detectie probleme rulat o singura data

# Exemplu de utilizare

```
$hostname = "localhost";  
$database = "world";  
$username = "web";  
$password = "ceva";  
$conex= mysql_connect($hostname, $username, $password);  
mysql_select_db($database, $ conex);
```

```
$query = "SELECT `Code`, `Name`, `Population` FROM `country` AS c ";  
$result = mysql_query($ query, $ conex) or die(mysql_error());  
$row_result = mysql_fetch_assoc($ result );  
$totalRows_result = mysql_num_rows($ result );
```

# Exemplu de utilizare

```
<?php
do {?>
<tr>
    <td><?php echo $index; ?>&nbsp;</td>
    <td><?php echo $ row_result ['Code']; ?>&nbsp;</td>
    <td><?php echo $ row_result ['Name']; ?>&nbsp;</td>
    <td><?php echo $ row_result ['Population']; ?>&nbsp;</td>
</tr>
<?php
    $index++;
}
while ($ row_result = mysql_fetch_assoc($ result )); ?>
```

# Modificari laborator cu date stocate text

- Codul aplicatiei ramane in mare parte acelasi
- Se modifica doar citirea valorilor pentru popularea matricii \$produse ("antet.php")

```
$matr=file("produse.txt");  
foreach ($matr as $linie)  
{  
    $valori=explode("\t",$linie,5);  
    $produse[$valori[0]] [$valori[1]]=array ("descr" => $valori[2], "pret" => $valori[3], "cant" =>  
$valori[4]);  
}
```

# Modificari laborator cu date stocate XML

```
$xml = simplexml_load_file("lista.xml");
if ($xml)
{
    foreach ($xml->categorie as $categorie)
    {
        $produce[(string)$categorie["nume"]]=array();
        foreach ($categorie->produs as $prod_cur)
        {
            $produce[(string)$categorie["nume"]][(string)$prod_cur->nume]=array
            ("descr" => (string)$prod_cur->desc, "pret" => (string)$prod_cur->pret,
            "cant" => (string)$prod_cur->cant);
        }
    }
}
```

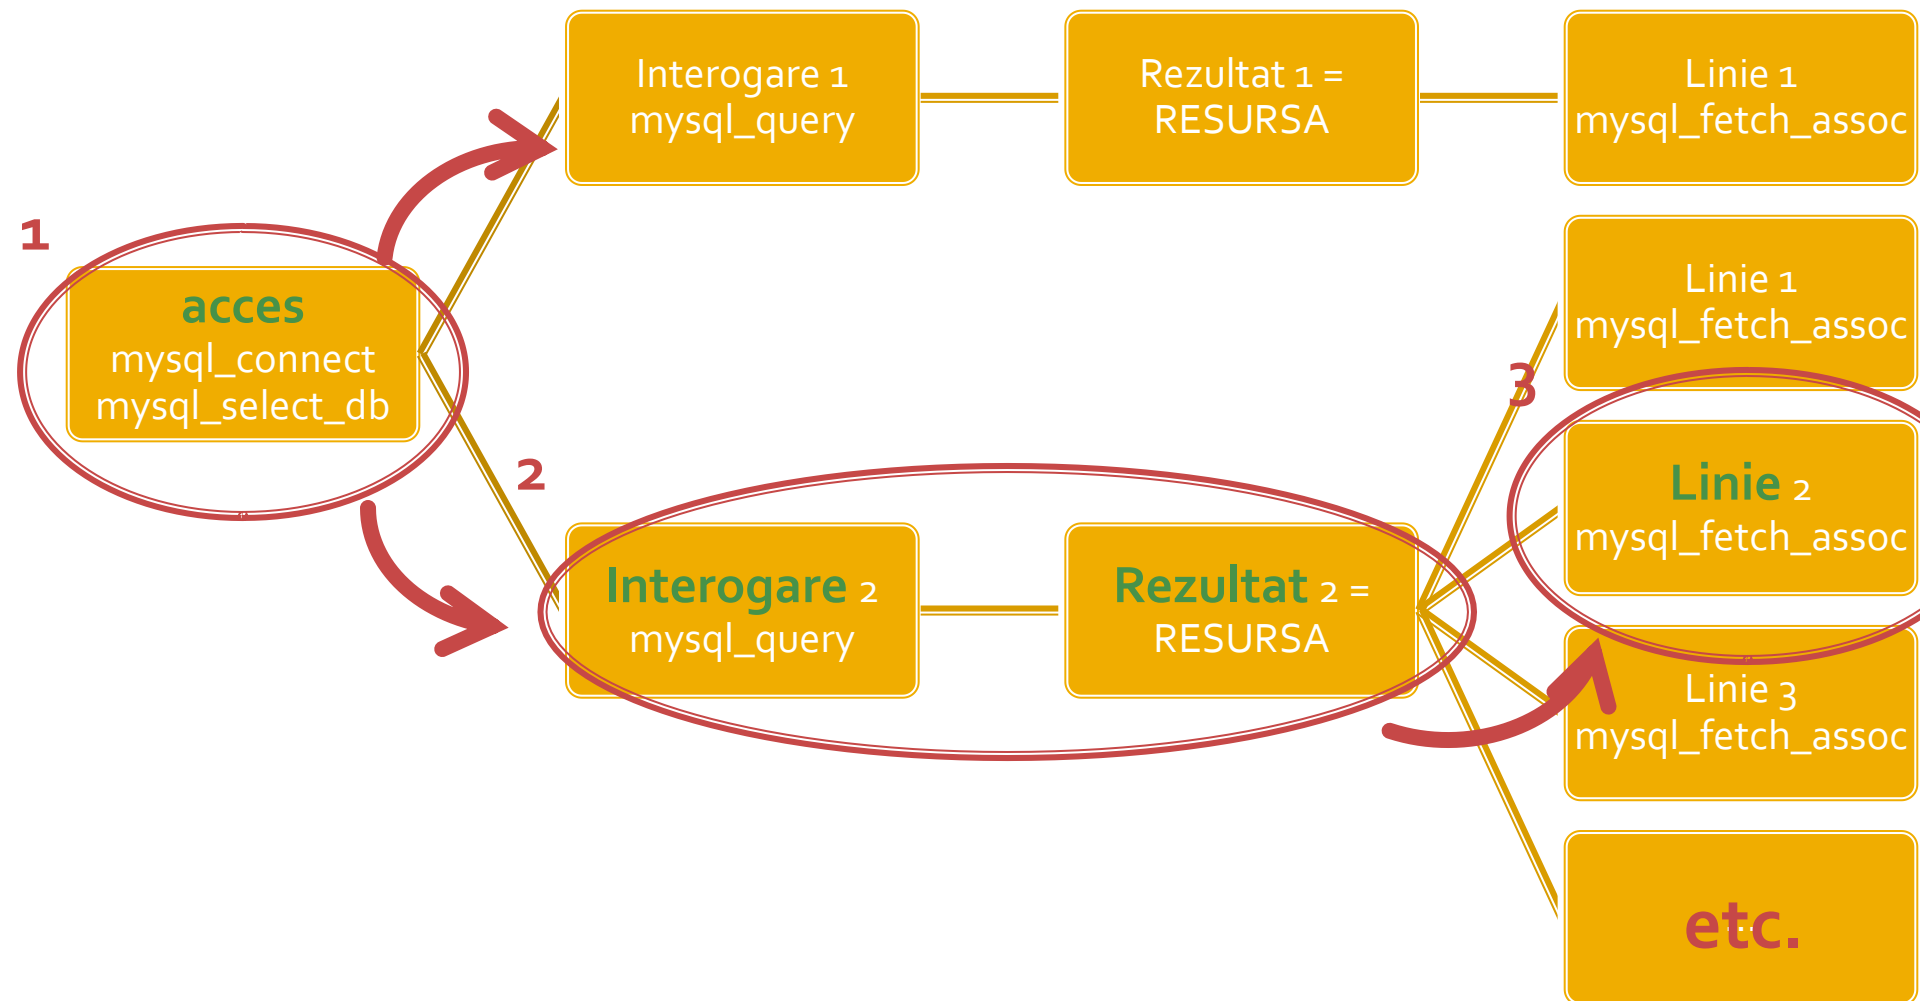

# Modificari laborator cu date stocate

## MySQL

```
$hostname = "localhost";
$database = "tmpaw";
$username = "web";
$password = "test";
$conex= mysql_connect($hostname, $username, $password);
mysql_select_db($database, $conex);
$query = "SELECT * FROM `categorii` AS c";
$result_c = mysql_query($query, $conex) or die(mysql_error());
$row_result_c = mysql_fetch_assoc($result_c);
$totalRows_result_c = mysql_num_rows($result_c);
do {
    $query = "SELECT * FROM `produse` AS p WHERE `id_categ` = ".$row_result_c['id_categ'];
    $result_p = mysql_query($query, $conex) or die(mysql_error());
    $row_result_p = mysql_fetch_assoc($result_p);
    $totalRows_result_p = mysql_num_rows($result_p);
    $produse[$row_result_c['nume']] = array();
    do {
        $produse[$row_result_c['nume']][$row_result_p['nume']] = array ("descr" =>
$row_result_p['detalii'], "pret" => $row_result_p['pret'], "cant" => $row_result_p['cant']);
    }
    while ($row_result_p = mysql_fetch_assoc($result_p));
}
while ($row_result_c = mysql_fetch_assoc($result_c));
```

# Functii de acces la server-ul MySql

!! IMPORTANT

**PHP > 5.5**

# PHP 5.5

- Incapand cu versiunea 5.5 a PHP extensia mysql este declarata **depreciata**
  - orice utilizare a unei functii genereaza eroare de tip **E\_DEPRECATED**
  - se preconizeaza ca in PHP > 6 aceasta extensie va fi eliminata total (**realizat**)
- Alternativele de utilizare sunt
  - extensia mysqli (MySQL Improved)
  - extensia PDO (PHP Data Objects)

# Extensia mysql

- Inafara securitatii sporite ofera acces la facilitatile curente ale server-ului MySQL
  - accesul la interogari predefinite (Prepared Statements) (viteza, securitate)
    - server side
    - client side
  - proceduri stocate pe server (viteza, securitate)
  - interogari multiple
  - tranzactii (integritate)

# Extensia mysqli

- Doua modalitati de utilizare
  - procedurala (similar mysql)
  - POO (similar PDO)
- Utilizarea procedurala (aproape) similara cu utilizarea extensiei originale mysql
  - tranzitie facila
  - tranzitie cu mici diferente de parametri

# mysqli – Procedural

```
<?php
$mysqli = mysqli_connect("example.com", "user", "password", "database");
$res = mysqli_query($mysqli, "SELECT 'Please do not use the mysql extension ' AS _msg FROM DUAL");
$row = mysqli_fetch_assoc($res);
echo $row['_msg'];

$mysql = mysql_connect("example.com", "user", "password");
mysql_select_db("test");
$res = mysql_query("SELECT ' for new developments.' AS _msg FROM DUAL", $mysql);
$row = mysql_fetch_assoc($res);
echo $row['_msg'];
?>
```

- toate functiile mysql au un echivalent mysqli
- majoritatea functiilor au aceeasi parametri in aceeasi ordine
- sunt totusi functii cu mici diferente (Ex: **mysqli\_connect**, **mysqli\_query**)

# mysqli – Programare orientata object

```
<?php
$var = new mysqli("example.com", "user", "password", "database");
$res = $var->query ($mysqli, "SELECT 'Please do not use the mysql extension ' AS _msg FROM DUAL");
$row = $res->fetch_assoc();
echo $row['_msg'];

$mysqli = mysqli_connect("example.com", "user", "password");
mysqli_select_db("test");
$res = mysqli_query("SELECT ' for new developments.' AS _msg FROM DUAL", $mysqli);
$row = mysqli_fetch_assoc($res);
echo $row['_msg'];
?>
```

# Plan aplicatie

# Plan aplicatie – vanzator

- Deoarece citirea datelor se face in fisierul antet.php (modificat anterior) vor aparea modificari doar la nivelul scrierii datelor noi introduse
- Fisiere
  - admin\_lista.php – nemodificat
  - admin\_categ.php – scrie categorii noi in baza de date: se incuieste cod XML cu cod MySql
  - admin\_formular.php – scrie produse noi / corectii in baza de date: se incuieste cod XML cu cod MySql

# admin\_categ.php

```
if (isset($_POST["c_nou"]))
    {
        //categorii noua introdusa
        $categ_nou=$xml->addChild("categorii");
        $categ_nou->addAttribute("nume", $_POST["nou"]);
        $xml->asXML("lista.xml"); // salvare fisier
        $produse[$_POST["nou"]]=array(); // update matrice produse
        echo "<p>Categorii ".$_POST["nou"]." adaugata!</p>";
    }
```

```
if (isset($_POST["c_nou"]))
    {
        //categorii noua introdusa
        $query = "INSERT INTO `categorii` (`nume`, `detalii`) VALUES ('
".$_POST["nou_nume"]."`, '".$_POST["nou_desc"]."')";
        echo $query; //util in perioada de testare
        $result = mysql_query($query, $conex) or die(mysql_error());
        $record=mysql_insert_id(); //obtinerea id-ului nou
        $produse[$_POST["nou_nume"]]=array(); // update matrice produse
        echo "<p>Categorii ".$_POST["nou_nume"]." adaugata! Are id = ".$record."</p>";
    }
```

# admin\_categ.php

## Magazin online Firma X SRL

INSERT INTO `categorii` (`nume`, `detalii`) VALUES ('jucarii', 'pentru copii')

Categoria jucarii adaugata! Are id = 4

# admin\_formular.php

- Pentru inlocuire/adaugare produs apare o tratare diferita a celor doua situatii:
  - Adaugarea de produs face apel la interogarea SQL `INSERT INTO `produse` ...`
  - Modificarea unui produs existent va face apel la interogarea SQL `UPDATE `produse` SET ...`

# admin\_formular.php

```
if (isset($_POST["prod_ant"]))//exista deja acest produs anterior?
    //exista deja acest produs UPDATE
    unset($produse[$_POST['categ']][$_POST['prod_ant']]);//trebuie sters produsul anterior inlocuit
    $query = "UPDATE `produse` SET `nume`='".$_POST["prod"]."', `detalii`='".$_POST["descriere"]."',
`cant`='".$_POST["cantitate"]."', `pret`='".$_POST["pret"]."' WHERE `nume`='".$_POST["prod_ant"].'";
    echo $query;//util in perioada de testare
    $result = mysql_query($query, $conex) or die(mysql_error());
    echo "<p>Produsul '".$_POST["prod"]."' modificat in categoria '".$_POST['categ']."'!</p>";
}

else

```

# Laborator 6

# Laborator 6

- Sa se continue magazinul virtual cu:
  - produsele sunt grupate pe categorii de produse
  - sa prezinte utilizatorului o lista de grupe de produse pentru a alege
  - sa prezinte utilizatorului o lista de produse si preturi in grupa aleasa
  - lista de produse si preturi se citeste dintr-o baza de date **MySQL**
  - se preia comanda si se calculeaza suma totala
  - **se creaza paginile prin care vanzatorul poate modifica preturile, produsele, categoriile**

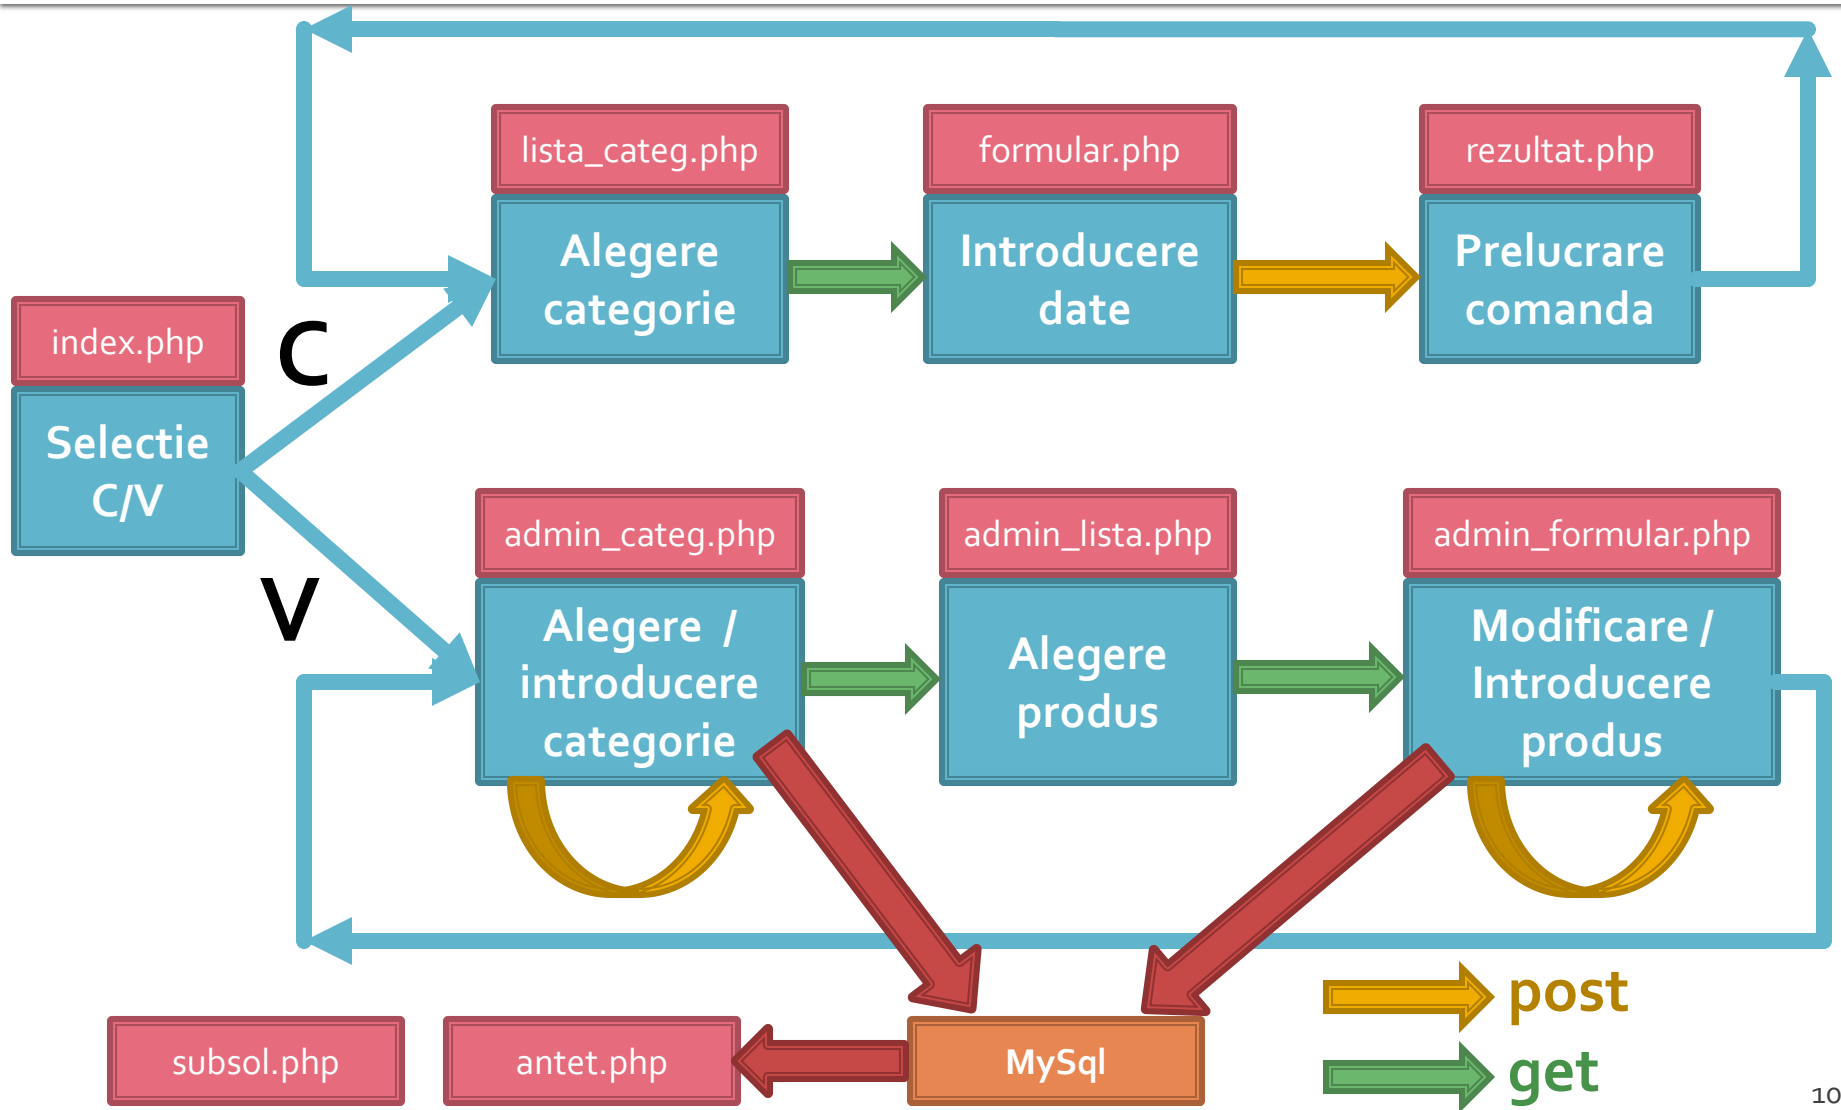

# Laborator 6/7 – Mod de lucru

- Se continua lucrul la aplicatie (L5)
- Se recomanda laboratorul **asincron** – S2
- Se poate folosi fisierul cu surse cpypaste.txt (site-<http://rf-opto.etti.tuiasi.ro>)

# Laborator 6/7 – Mod de lucru

- Se ia o decizie relativ la relatia dintre produse si categorii (S24-S28)
  - One to Many
  - Many to Many
- Se creaza cele 2(3) tabele corespunzatoare
- Se populeaza cu date
- Se actualizeaza planul aplicatiei pentru a corespunde cu aplicatia proprie
  - nume de fisiere, tipuri de transfer a datelor

# Faza de verificare/depanare

- Se recomanda utilizarea posibilitatii vizualizarii matricilor
  - In fisierul care receptioneaza datele
  - temporar pina la definitivarea codului
- utilizarea de cod "verbose" (manual) in etapele initiale de scriere a surselor PHP poate fi extinsa si la alte tipuri de date
  - singura (aproape) metoda de depanare(debug) in PHP
  - `<p>temp <?php echo "a=";echo $a; ?> </p>`

```
echo "<pre>";  
print_r($_POST);  
echo "</pre>";
```

# Depanare

```
echo "<pre>";  
print_r($_POST);  
echo "</pre>";
```

```
<p>temp <?php echo  
"a=";echo $a; ?> </p>
```
